

Finding the Slippery Slope: Detecting Landslides from Space

Dr. Dalia Kirschbaum

Research Scientist

NASA Goddard Space Flight Center

Why Landslides?

1. They are important geomorphologically

Movement of a mass of rock, debris, earth, or soil down a hill

2. They are pervasive

Triggered in nearly every country in the world and state in the U.S.

3. They impact people

Landslides have killed over 26,000 people worldwide since 2007 (~3,700/year) and impacted millions

Why from Space?

NASA's BIG QUESTION:

How is the global earth system changing and how will it change in the future?

Remote Sensing enables us to study our environment across the globe

The rundown...

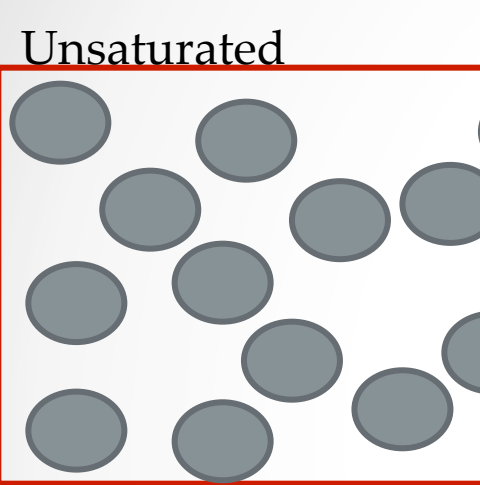

1. Landslides 101
2. Where and when they occur
3. Observation with remote sensing
4. Modeling Efforts
5. Where can you get more information?

Landslides 101

To build a sandcastle...

Landscape catalyst

A landslide by any other name...

Interstate 40, Tennessee
<https://news.tn.gov>

Vulcan Casita, Nicaragua

usgs.gov

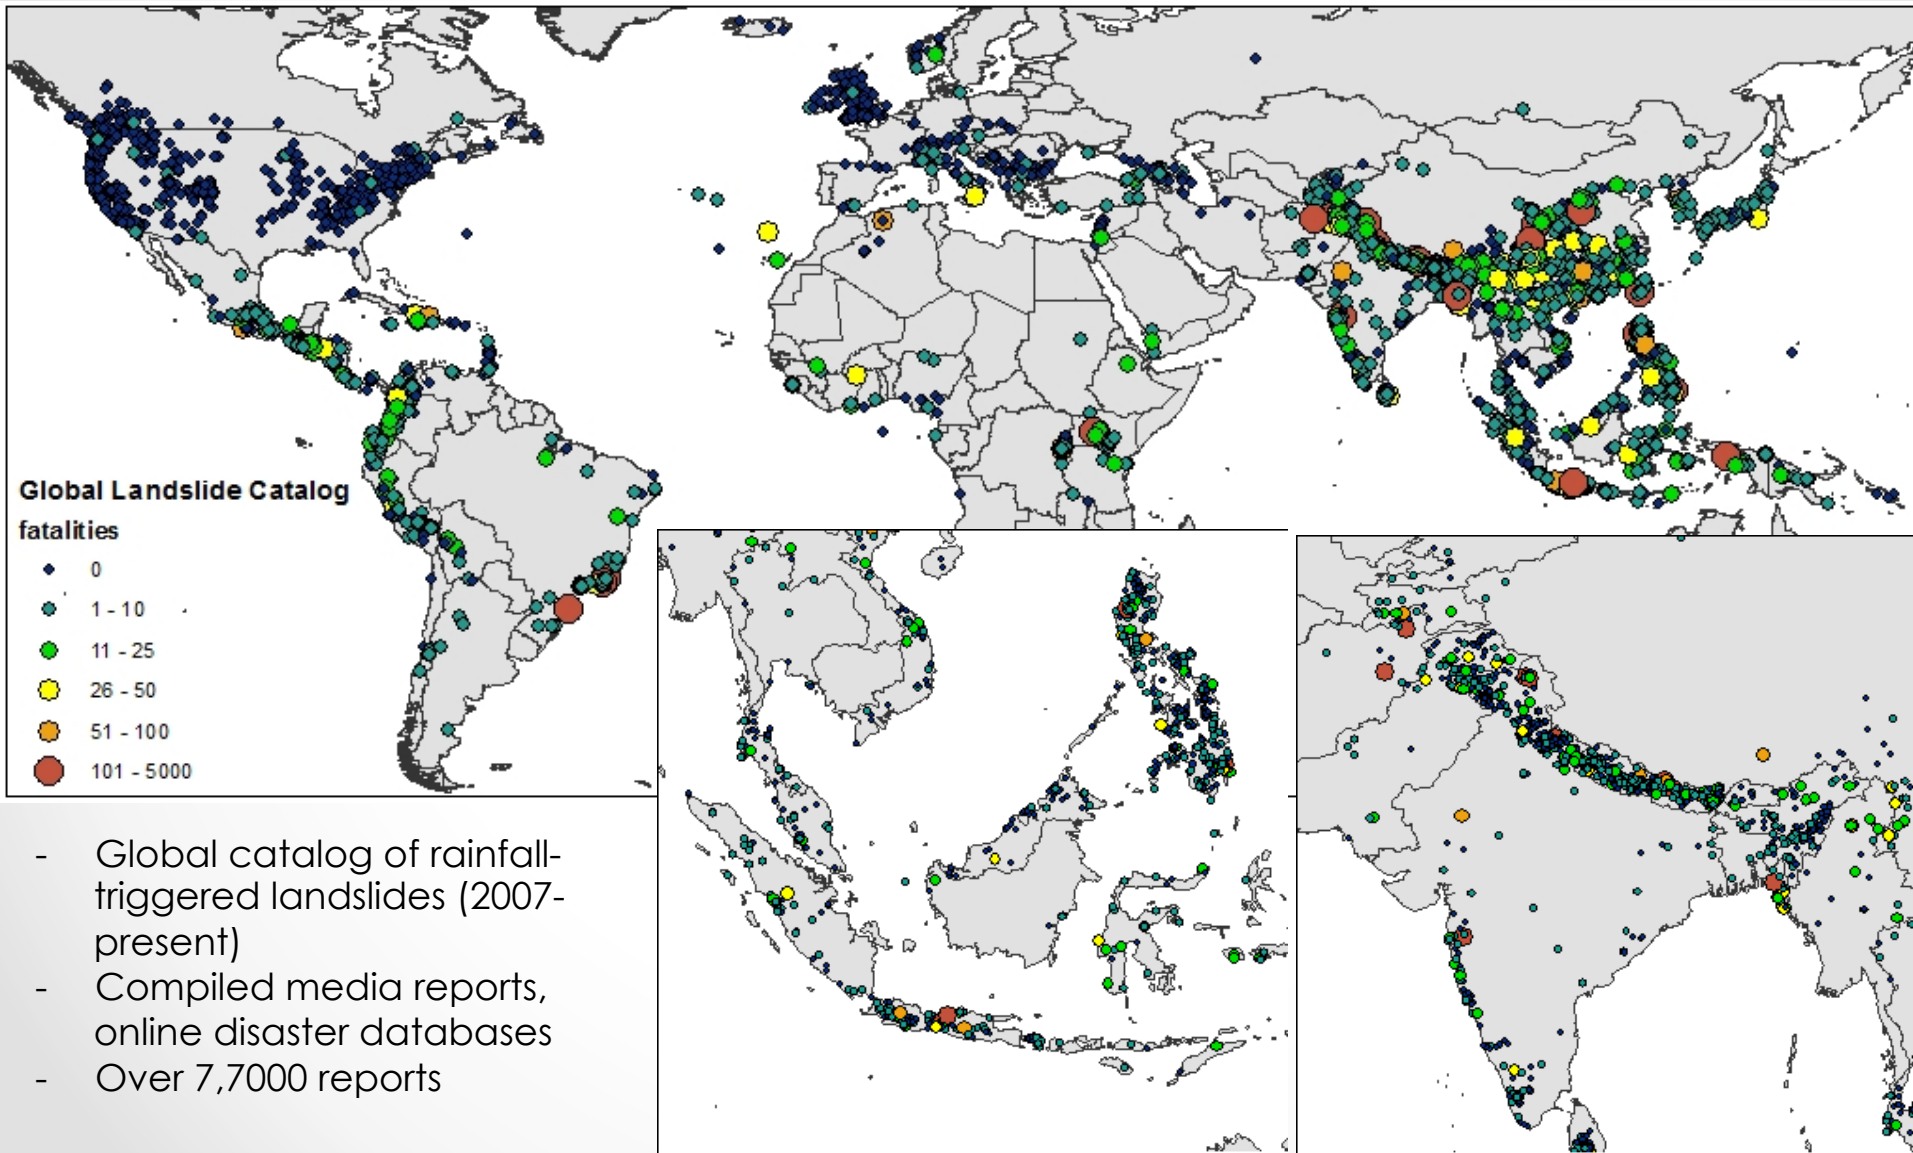

December 15, 1998

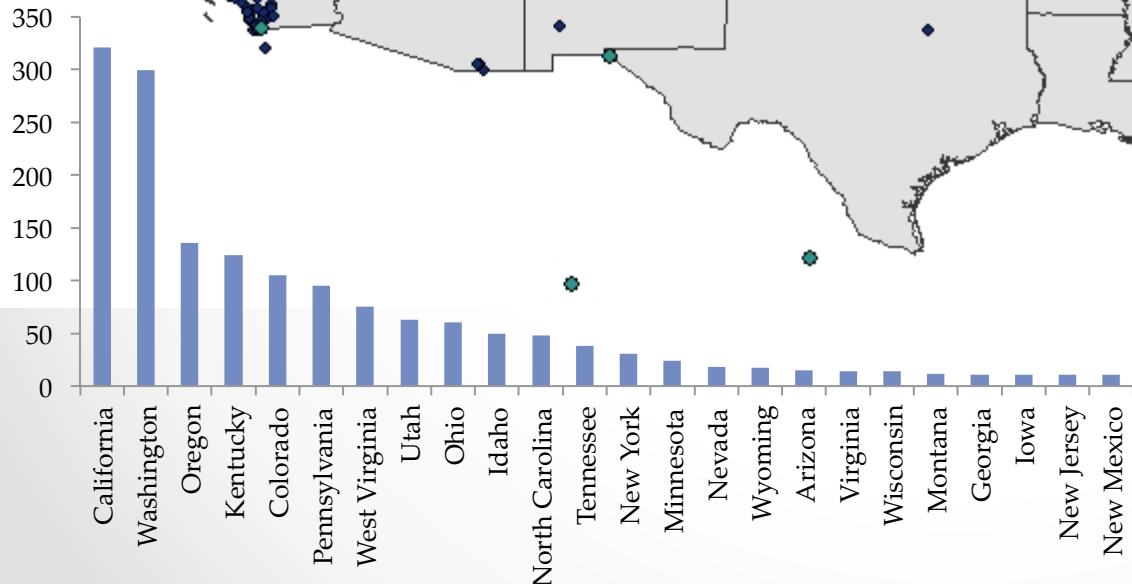

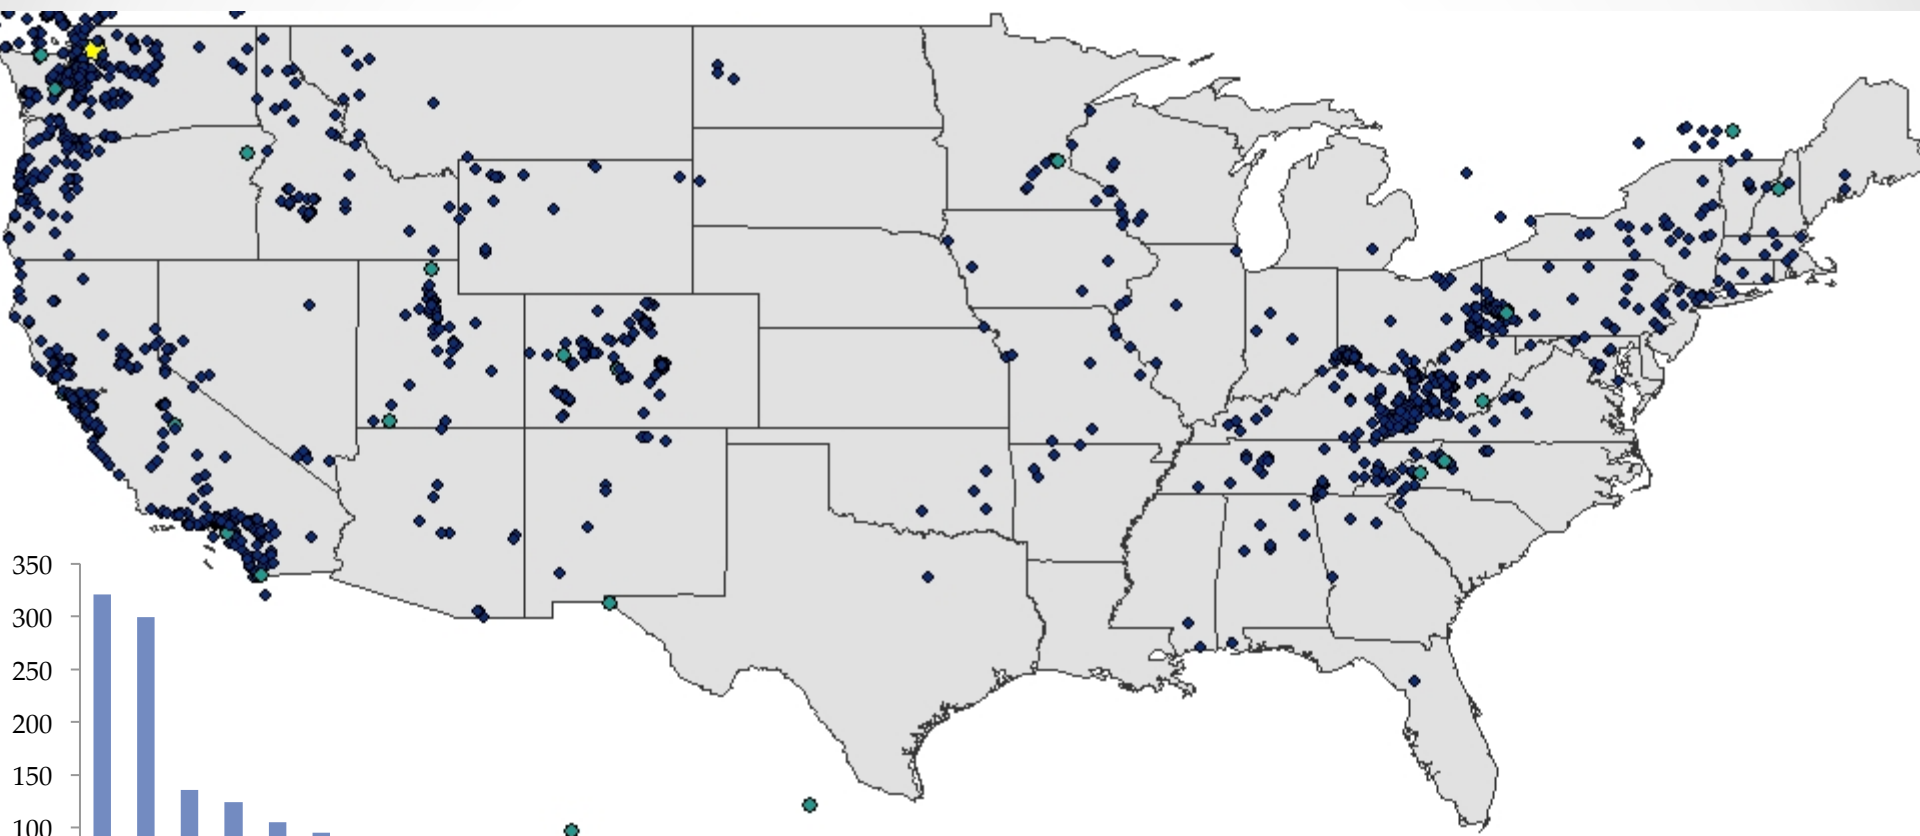

Landslid

Taiwan
<http://www.chinadaily.com.cn>

Where are they?

In our backyard

- 44 states with reported rainfall-triggered landslides
- California and Washington have 36% of the total reports

Where are they?

2012 GDP vs. fatalities by country

Landslide Reports

Landslide Fatalities

When are they?

- And the “winner” is ... rainfall, in a landslide
- Over 98% percent of landslides are triggered by landslides (Petley et al. 2003)
- Landslide reports and fatalities peak in Northern Hemisphere Summer

3. Observations of Landslides

- Airborne or ground based imagery can get detailed views of events, but have cost and time restrictions
- Satellite detection can get at the “where” of the event but often not the “when” and is also impacted by clouds and revisit times

Airborne

Satellite: Commercial

Satellite: NASA

meter resolution)

Langtang Valley

- Langtang Valley was **severely affected** by the main earthquake and aftershocks.
- Several villages destroyed or damaged, **more than 200 people killed**, dozens missing.
- Information relayed to authorities resulted in relief helicopter missions to area
- Recurrent landsliding resulted in **complete evacuation** and **public closure** of the valley.

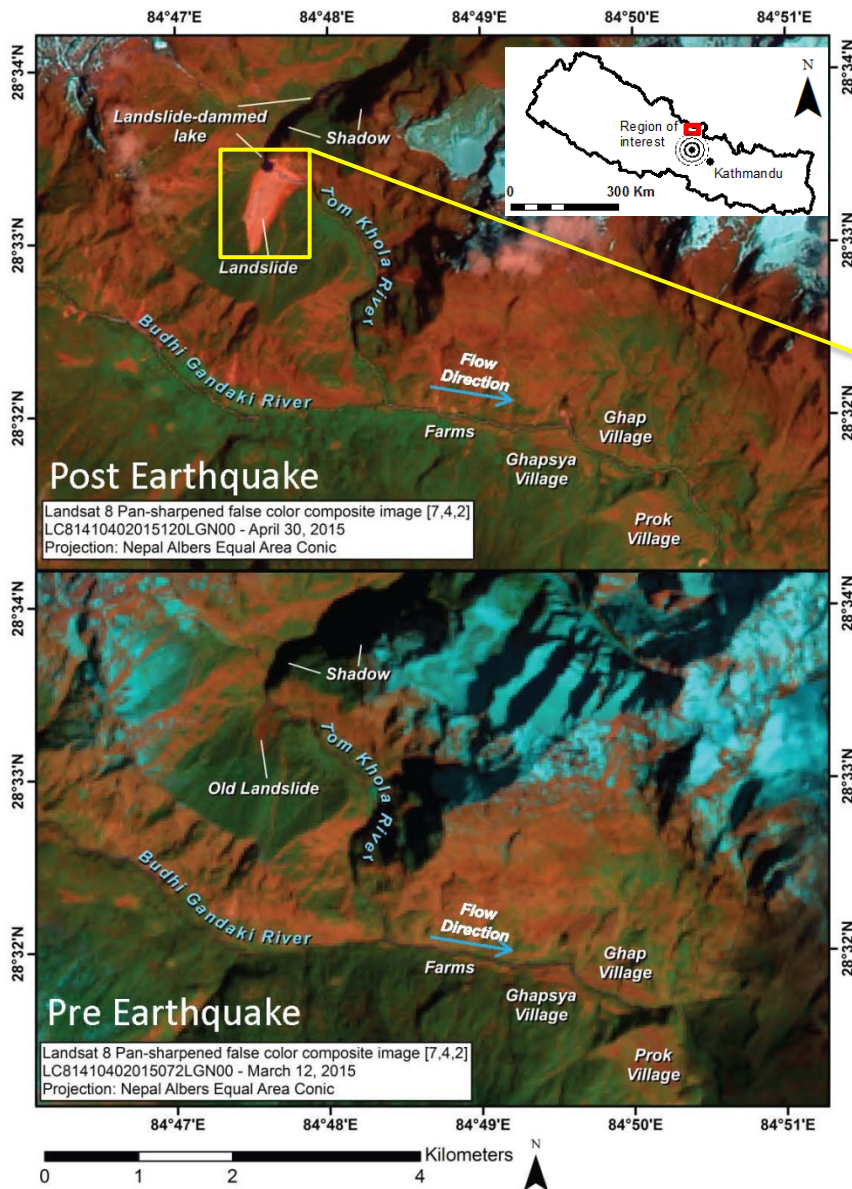

Walter Immerzeel (U Utrecht)
Philip Kraaijenbrink (U Utrecht)

Ghap landslide-dammed lake, Manaslu

- ~450 m wide landslide at its base at river level and originated from a point ~1 km up slope.
- ~150 m wide and 1.4 km long dammed lake
- Lake still exists and rose slightly as of May 17 Landsat coverage

4. Modeling Landslide Activity

NASA satellite data can be used to help anticipate, predict or observe landslides

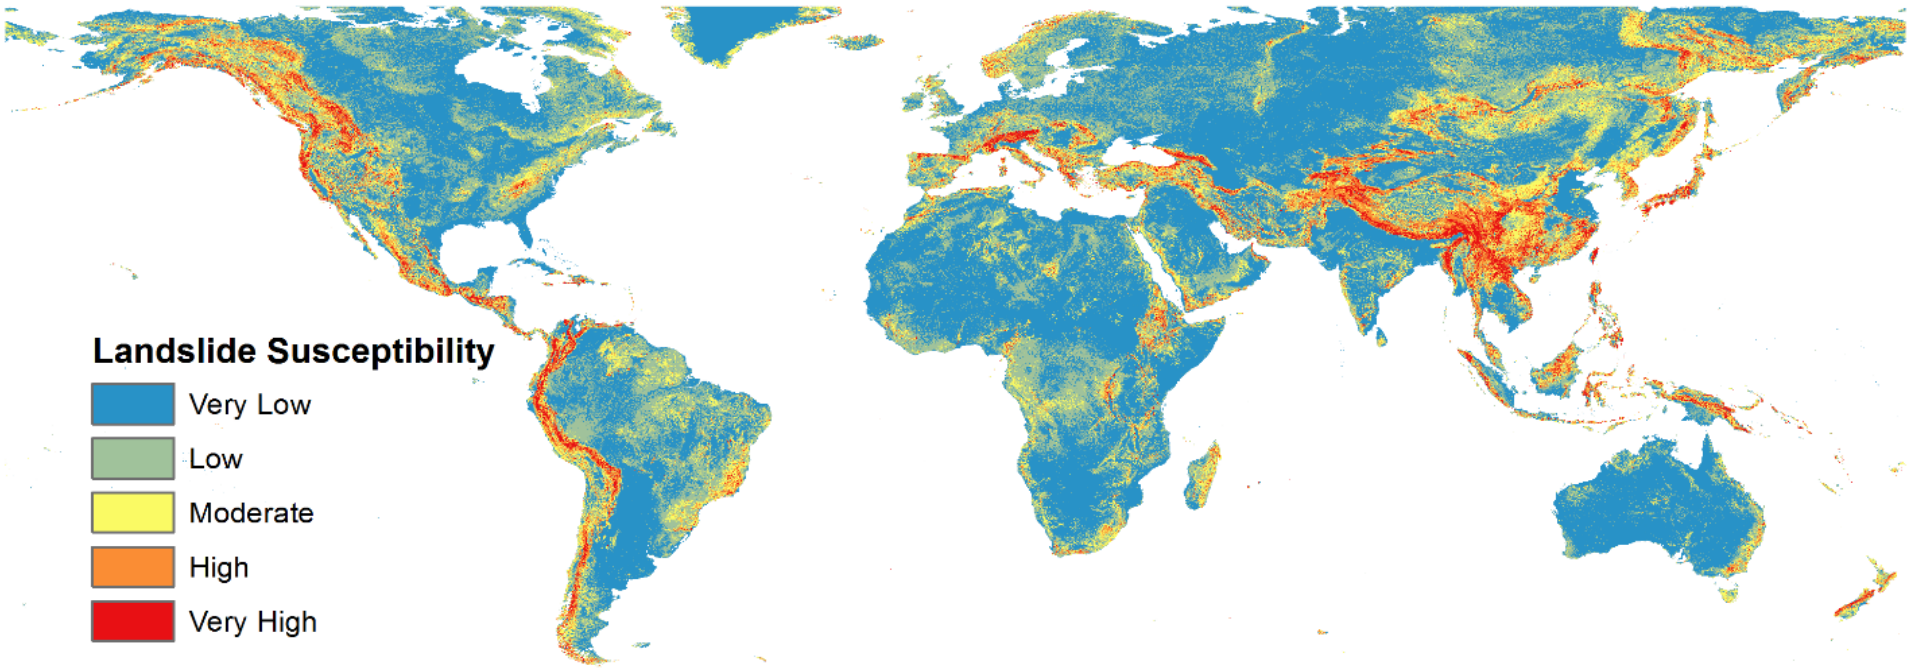

Relevant Datasets (and where to get them)

Data type	Data Set	Resolution/Map Scale	Source and website
Elevation	Digital Elevation Models	ASTER, near global, 30m	https://asterweb.jpl.nasa.gov/gdem.asp
	SRTM 30m	30m, near global	https://lta.cr.usgs.gov/SRTM1Arc
Forest Loss	Global Forest Change and Land Analysis	30 m	http://glad.umd.edu/dataset
Road Networks	Global Roads: gROADS	Variable	http://sedac.ciesin.columbia.edu/data/set/groads-global-roads-open-access-v1
Population	CIESIN Gridded Population of the World (V3)	30 arc-seconds, ~1 km	http://sedac.ciesin.columbia.edu/data/collection/gpw-v3
Precipitation	TRMM Multi-satellite Precipitation Analysis (TMPA)	0.25° x 0.25° 3-hourly resolution, 12 hr latency	www.pmm.nasa.gov/data-access
	Integrated Multi-satellite Retrievals for GPM (IMERG)	0.1°, 30-minute, 5 hour latency	www.pmm.nasa.gov/data-access
Modeled Precipitation	GEOS-5 model (NASA), 24, 48, 73 hour precip forecast (updated every 6 hours)	0.3125° longitude x 0.25-degree° latitude	ftp://ftp.nccs.nasa.gov/fp/forecast/ http://gmao.gsfc.nasa.gov
Soil Moisture	Soil Moisture Active/Passive (SMAP)	~36 km, 1-3 day latency Higher resolution products planned	https://nsidc.org/data/smap

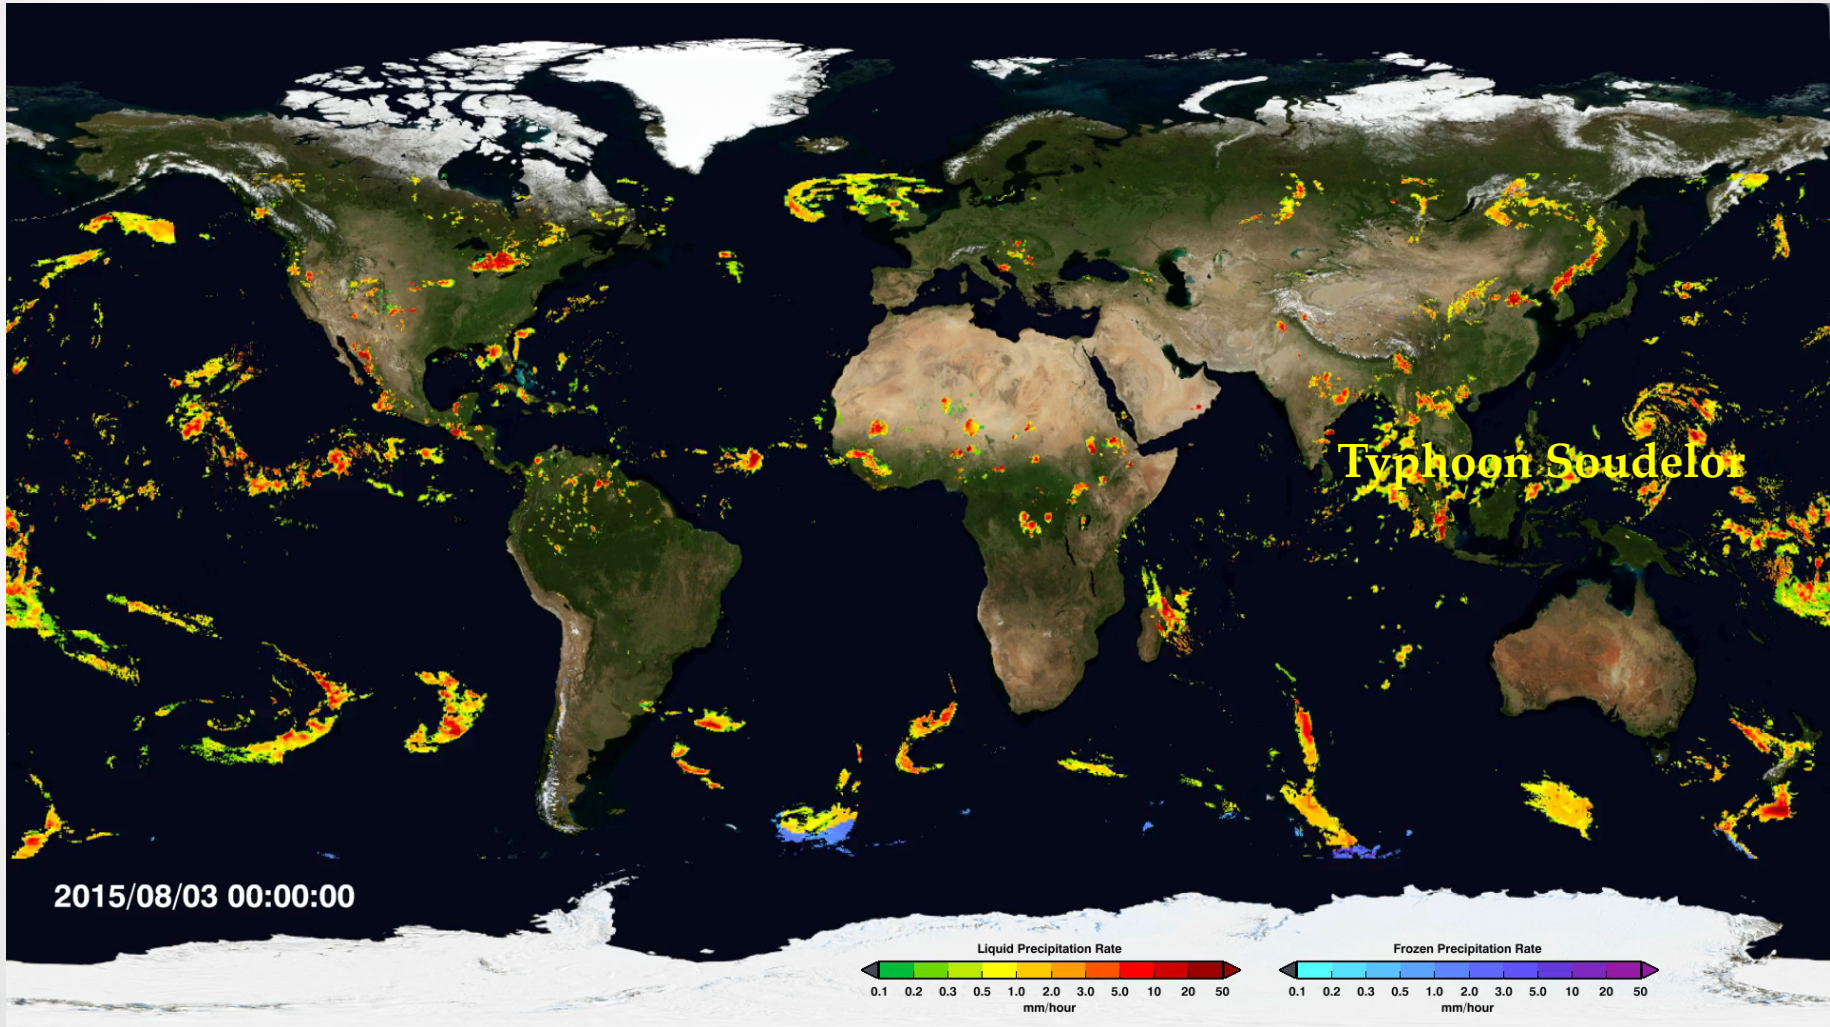

Global Landslide Susceptibility

Paper in development, those interested in the data should contact dalia.b.kirschbaum@nasa.gov

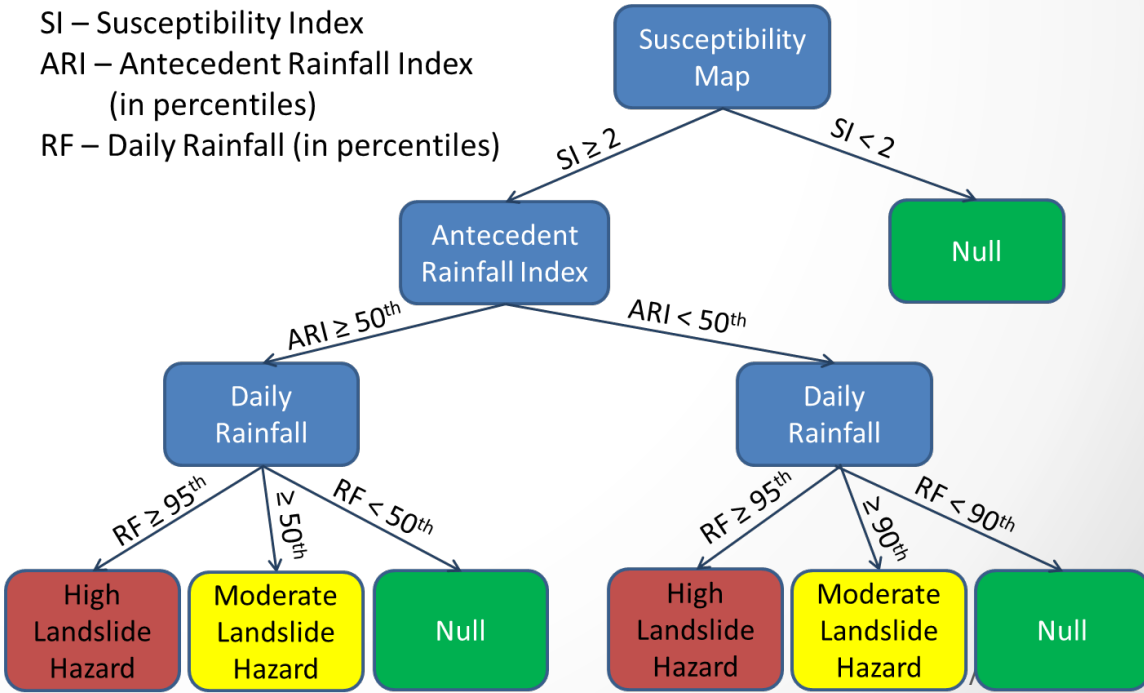

Global Picture of Rain and Snow

Landslide Hazard Assessment for Situational Awareness (LHASA)

- **Goal:** Develop landslide model based primarily on remotely sensed data that can provide a relative awareness of potential landslide activity regionally in near real-time
- **Approach:** Merge landslide susceptibility map with satellite-based rainfall information to represent potential hazard every day
- Threshold approach for both rainfall and susceptibility
- Estimate landslide nowcasts daily for regional situational awareness
- Rapid visualization and export data as vectors

Global LHASA Development

- Working to build moderate and high hazard Global LHASA with IMERG data
- Data will be available as GeoTiffs, Raster and via API (IMERG, Landslide Nowcasts, Global Flood Monitoring System – U of Maryland) at www.pmm.nasa.gov
 - API access to IMERG data at 30 minute, 3 hours, 1 day and 7 days
 - Global Landslide Catalog: Moderate and High Landslide Hazard “Nowcast”

More to do...

- **Remote sensing** already provides answer to questions about **landslide initiation, composition, hazard and risk**
- There are several different resources available
- **Landslide catalogs** remain one of the **biggest impediments** to more effective landslide modeling
- **Citizen scientists** can contribute to our global understanding and awareness of landslides through reporting events

Thank you!
