

# Measuring Atmospheric Carbon Dioxide from Space in Support of Climate Studies: Global and Regional Carbon Cycle Studies

Abhishek Chatterjee, OCO-3 Project Scientist, OCO-2 Deputy Project Scientist, Jet Propulsion Laboratory/Caltech

May 31, 2022

# Webinar Agenda

## Part 1: An Introduction to XCO<sub>2</sub> with OCO-2 and OCO-3

- EDT (UTC-4:00)
- Tuesday, May 24, 2022
- Trainers: Vivienne Payne (JPL)
- Background of the XCO<sub>2</sub> measurement and how it is measured
- Description of the OCO-2/OCO-3 sensors
- Characteristics, limitations and validation of the measurement
- Q&A

## Part 2: A Demonstration on how to Access and Visualize OCO-2/OCO-3 Data

- EDT (UTC-4:00)
- Thursday, May 26, 2022
- Trainers: Karen Yuen (JPL)
- Use of Jupyter Notebook to access, search, filter and display XCO<sub>2</sub> data
- Q&A

## Part 3: XCO<sub>2</sub> in Support of Global and Regional Climate-Related Studies

- EDT (UTC-4:00)
- Tuesday, May 31, 2022
- Trainers: Abhishek Chatterjee (JPL)
- Global and regional carbon flux estimation, and carbon cycle response to climate variability and changes in anthropogenic emissions
- Q&A

## Part 4: XCO<sub>2</sub> in Support of Local and Regional Climate-Related Studies

- EDT (UTC-4:00)
- Thursday, June 2, 2022
- Trainers: John Lin (University of Utah)
- Climate impacts from localized emissions, air quality, and urban density
- Q&A

# Overview

- Recap of OCO-2 and OCO-3 XCO<sub>2</sub> measurements
- Overview of the carbon cycle
- Higher-order products (Level 3 XCO<sub>2</sub> and Level 4 CO<sub>2</sub> Fluxes)
- Global and regional carbon cycle studies
  - Constraining CO<sub>2</sub> flux exchange between land and ocean surfaces & the atmosphere
  - Carbon cycle response to climate patterns and variability
  - Carbon cycle response to anthropogenic perturbation
- Summary

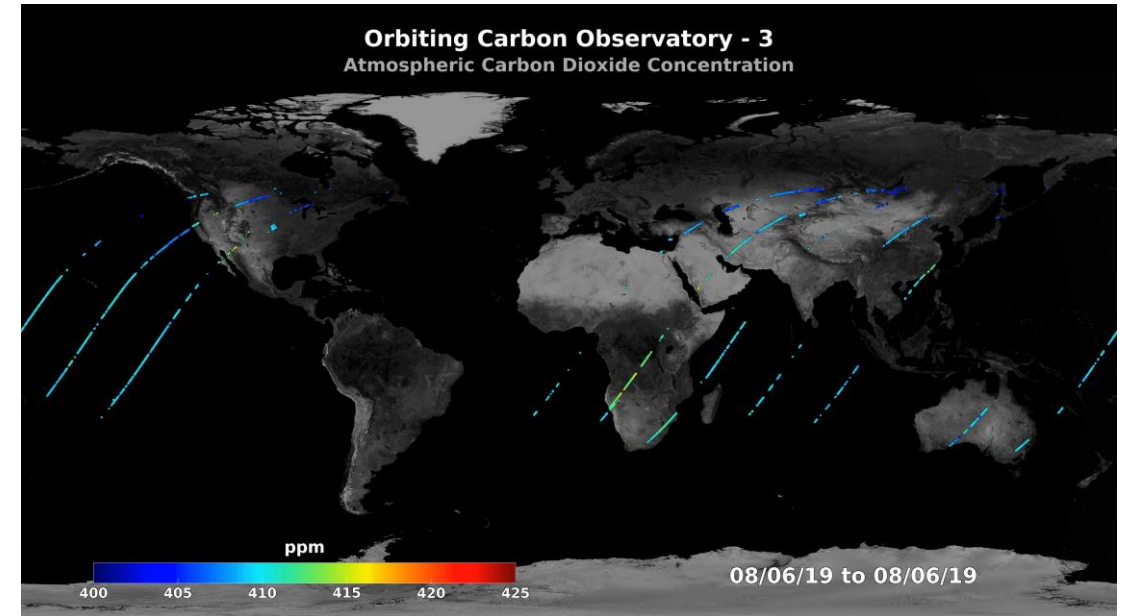

# Recap of OCO-2 and OCO-3 XCO<sub>2</sub> Measurements

- OCO-2 launched on July 2014 (data record spans 7.5+ years) and OCO-3 launched in May 2019 (data record spans 2.5+ years)
- Mission Objectives:
  - Retrieve estimates of the column-averaged dry air mole fraction of carbon dioxide (XCO<sub>2</sub>) at regional scales (>1,000 km) and with precision better than 0.25% (1 part per million)
- Data Collection:
  - Both OCO-2 and OCO-3 collect data in Nadir, Glint, and Target (specific locations on the ground) modes
  - OCO-3 has a 4<sup>th</sup> mode: Snapshot Area Mapping (SAM)
    - Enabled by utilizing the Pointing Mirror Assembly (PMA)
    - Targeted to a specific location and then slew to sweep across a region of ~100 km x ~100 km

# Recap of OCO-2 and OCO-3 XCO<sub>2</sub> Measurements

- Data are being used to study (400+ publications since 2014) -
  - Global and regional carbon cycle interactions, response of the carbon cycle to climate patterns, and extreme regional events including droughts, floods, and wildfires.
  - Quantification of CO<sub>2</sub> emissions from human activities, including large power plants and urban centers.

# Overview of the Carbon Cycle

# Atmospheric CO<sub>2</sub> Concentrations

# Human Activities Impact CO<sub>2</sub> Concentrations

# Earth's Carbon Cycle

[https://public.ornl.gov/site/gallery/originals/CCycle\\_cover\\_image.jpg](https://public.ornl.gov/site/gallery/originals/CCycle_cover_image.jpg)

## Gross $\text{CO}_2$ Fluxes:

### Land Biosphere

- Emissions  $\sim 550 \text{ Pg CO}_2 \text{ yr}^{-1}$
- Removals  $\sim 560 \text{ Pg CO}_2 \text{ yr}^{-1}$

### Ocean

- Emissions  $\sim 330 \text{ Pg CO}_2 \text{ yr}^{-1}$
- Removals  $\sim 340 \text{ Pg CO}_2 \text{ yr}^{-1}$

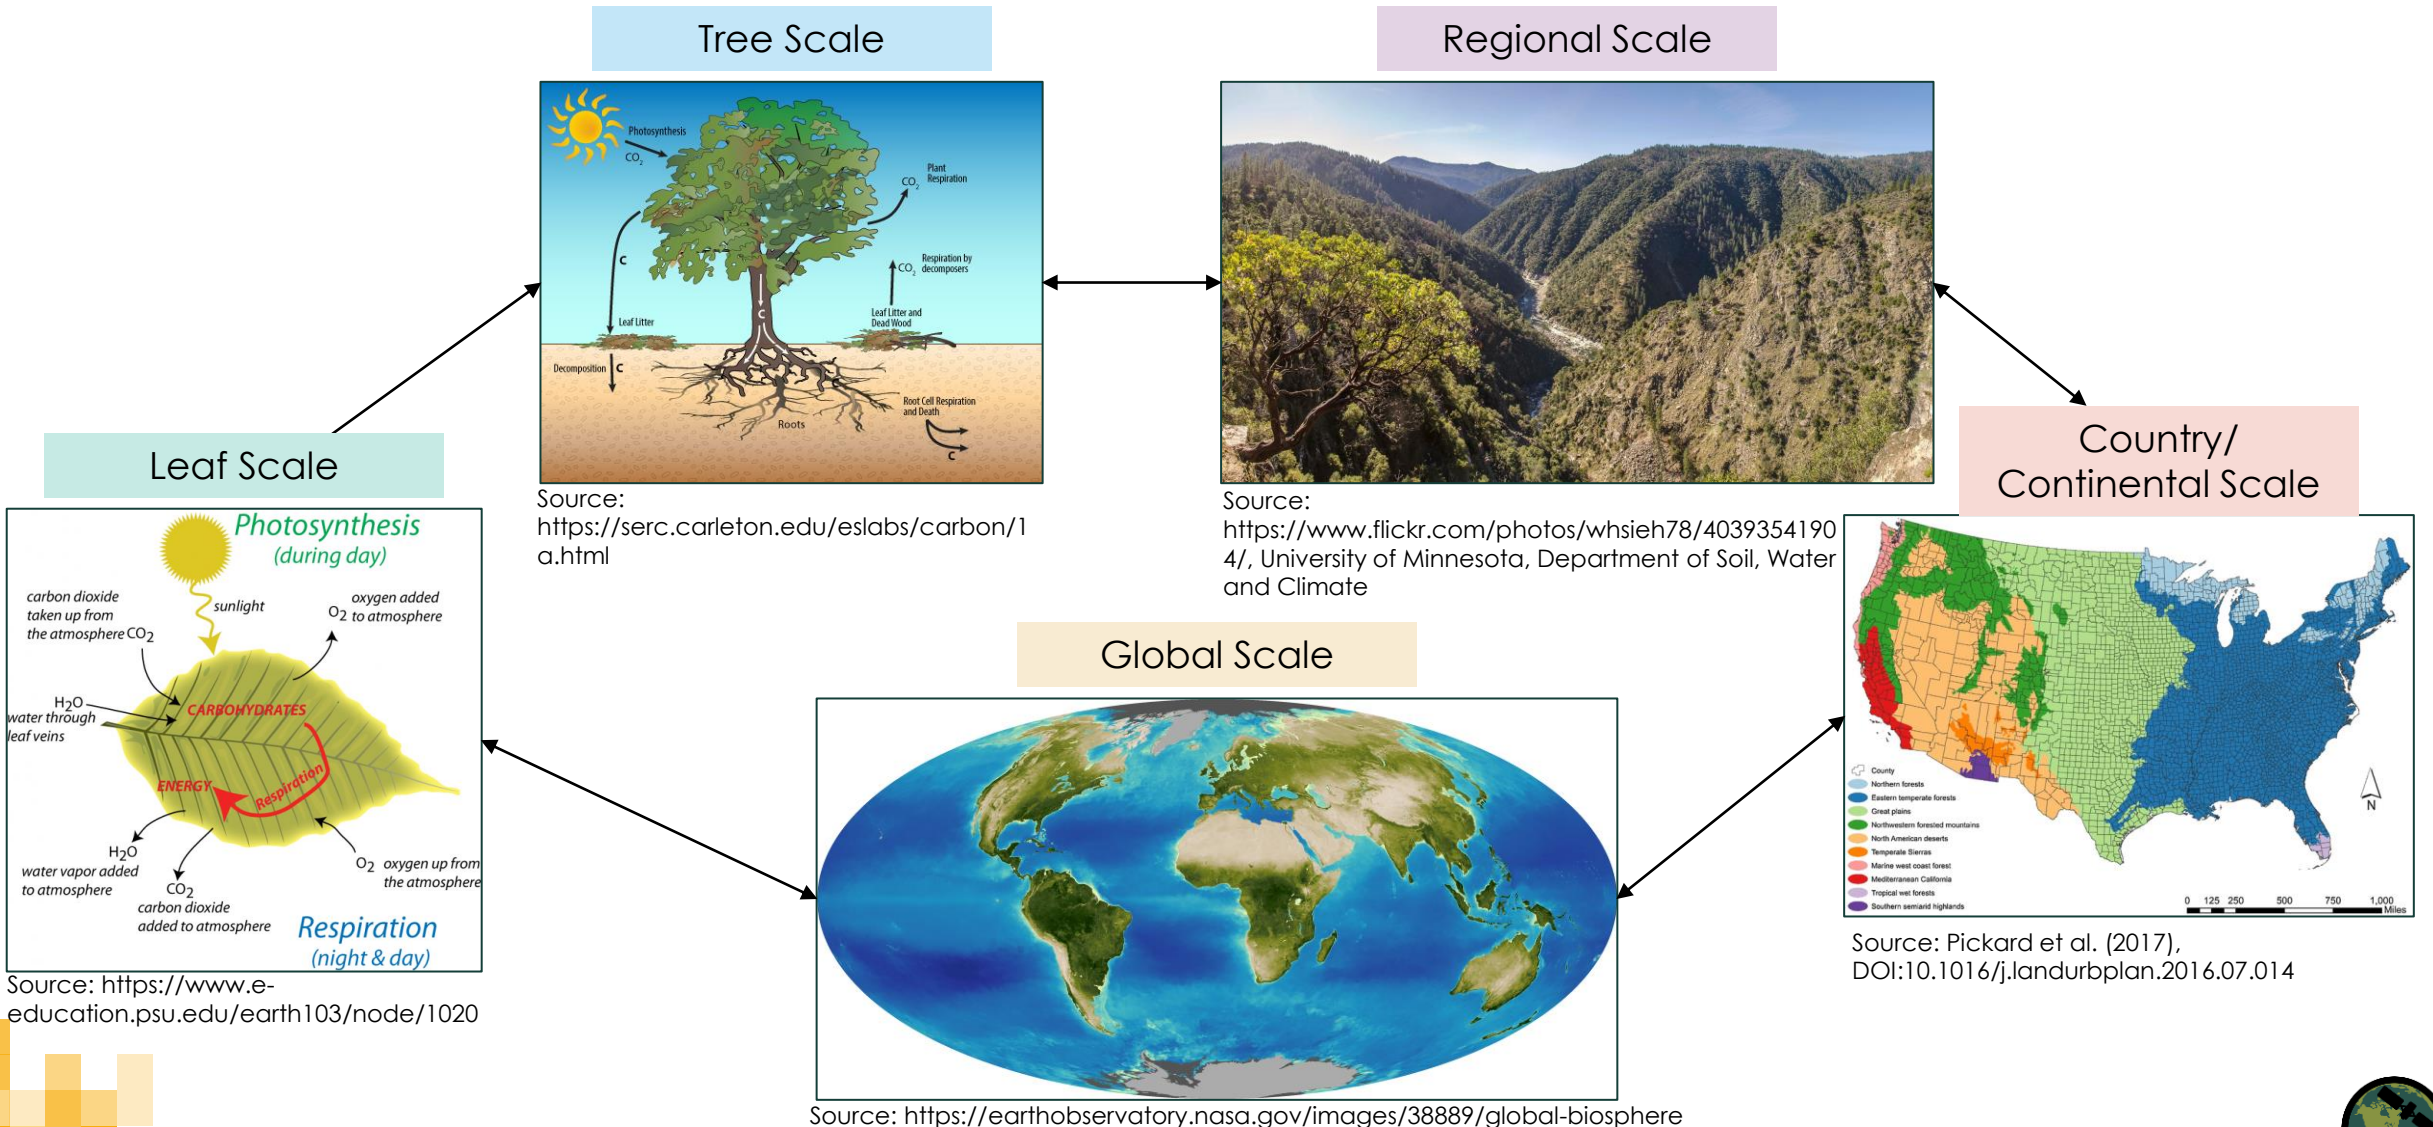

### Human Activities

- Emissions  $\sim 39 \text{ Pg CO}_2 \text{ yr}^{-1}$
- Removals  $\sim 0 \text{ Pg CO}_2 \text{ yr}^{-1}$

(1 Pg = 1 petagram = 1 billion metric tonnes  
=  $10^{15}$  grams)

# The Most Pressing Questions in Carbon Cycle Science

Carbon Cycle Science Questions	Grids	Carbon Cycle Science Questions	Grids
Marine physical - biogeochemical coupling	A1, B1	Disturbance & recovery	B3, B4, C3, C4, D3, D4
Coastal & inland processes	B2, C2	Contemporary net carbon sink	D2, D3, D4, E2, E3, E4
Phenology	A1, A2, A3	Land and ocean carbon budgets	D3, D4, E3, E4
Ecosystem physiology - weather interactions	B1, B2	CO <sub>2</sub> , N-fertilization, ocean acidification trends	A4, B4, C4
C cycle response to water stress events	C1, C2, C3	Permafrost carbon loss and emissions	C5, D5
C cycle response to climate variability	B2, B3, C2, C3, D2, D3	Land use, land management trends	B4, B5, C4, C5
Ecosystem ↔ atmosphere flux quantification	B2, B3, C2, C3	Migration of biomes	C5, D5

Higher-Order Products  
(Level 3 XCO<sub>2</sub> and Level 4 Carbon Fluxes)

# Higher-Order Products From Level 2 XCO<sub>2</sub> Data

- **Level 2** products have “gaps” – missing soundings due to cloud cover, thick aerosol layer, etc. These are also reported in units of concentrations (ppm).
- **Level 3** product - maps XCO<sub>2</sub> to one part per million (ppm) accuracy over the Earth's surface, typically in grids that are ~50 – 100 km in latitude and ~ 50 – 100 km in longitude. Think of this as ‘gap-filled’ maps.
- **Level 4** product - maps the distribution of CO<sub>2</sub> sources and sinks (fluxes in gC m<sup>-2</sup> yr<sup>-1</sup>) over the Earth's surface, typically in grids that are ~ 100 – 500 km in latitude and ~ 100 – 500 km in longitude. Can be generated from both Level 2 or Level 3 data via a mathematical framework known as ‘inverse modeling’.

# Higher-Order Products From Level 2 XCO<sub>2</sub> Data

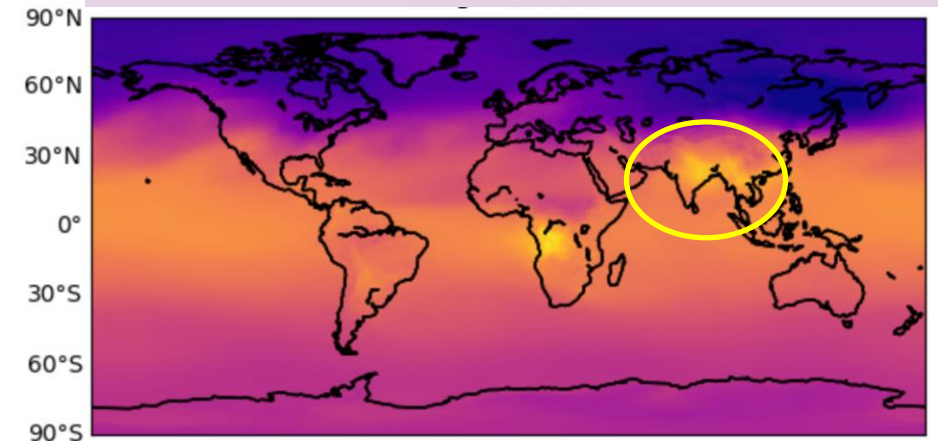

## Level 2 Product (August 2018)

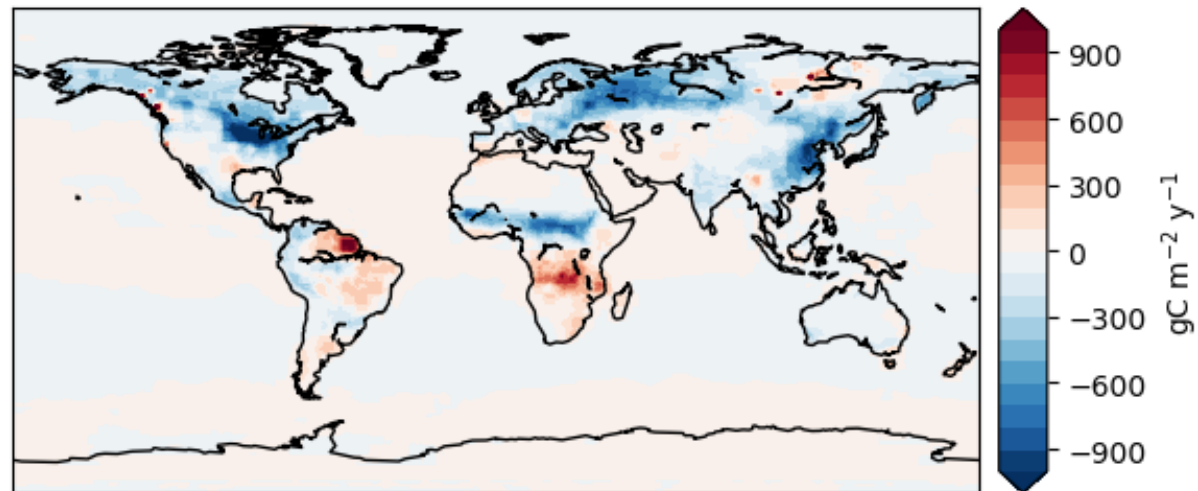

(c) WMO WDCGG Original data provided by the OCO-2 project at the Jet Propulsion Laboratory, California Institute of Technology.

Inverse Modeling Framework

## Level 3 (Aug 2018) – Gap-Filled XCO<sub>2</sub> Product

## Level 4 (Aug 2018) – CO<sub>2</sub> Flux Product

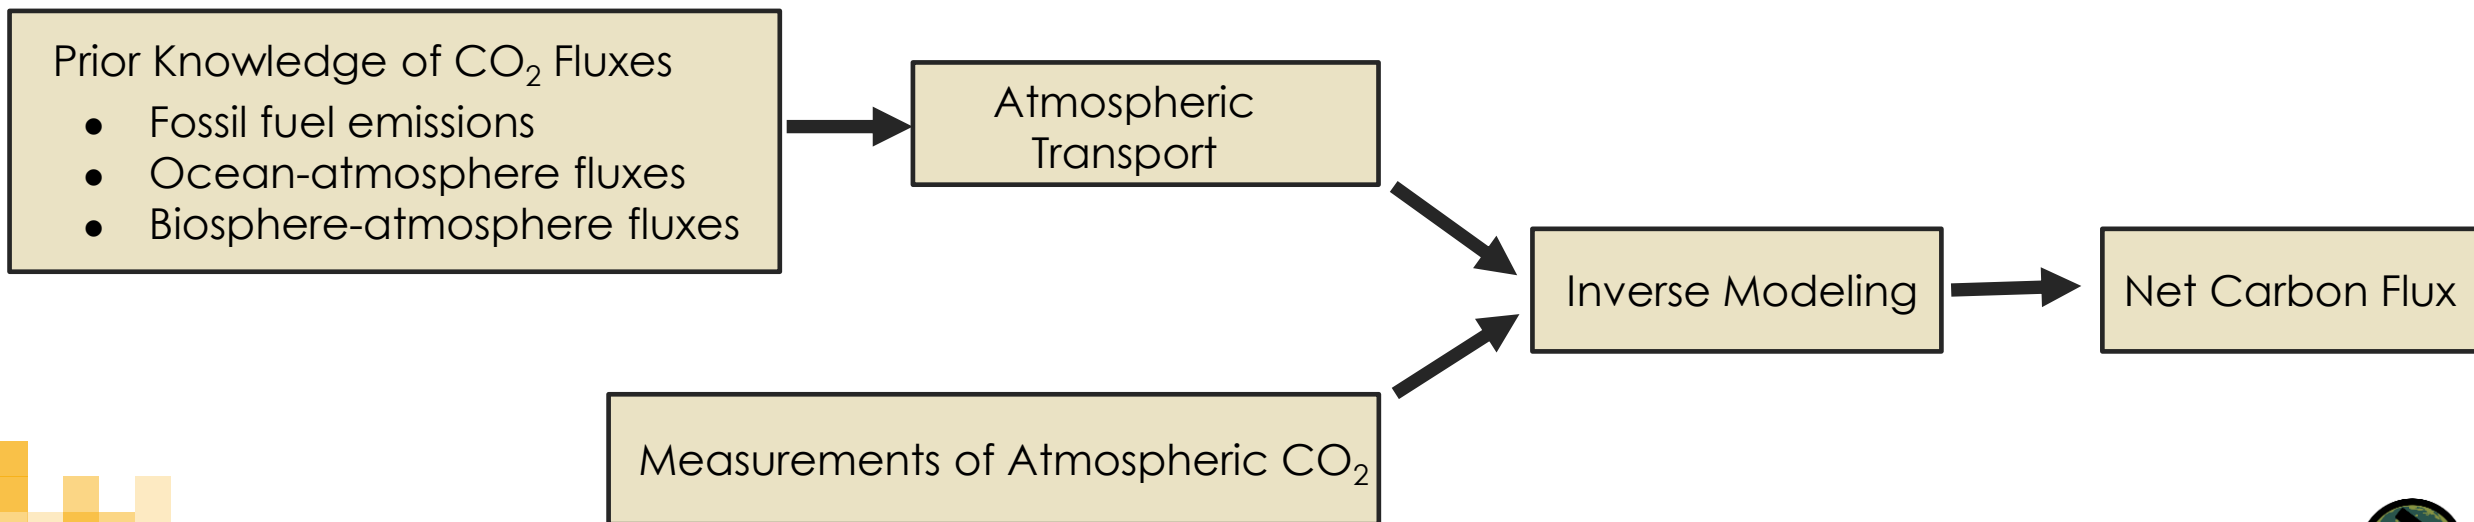

# Inverse Modeling

## Inverse Modeling:

- Inverse modeling allows us to estimate the CO<sub>2</sub> flux that agrees with observed atmospheric CO<sub>2</sub> concentrations.

## Framework:

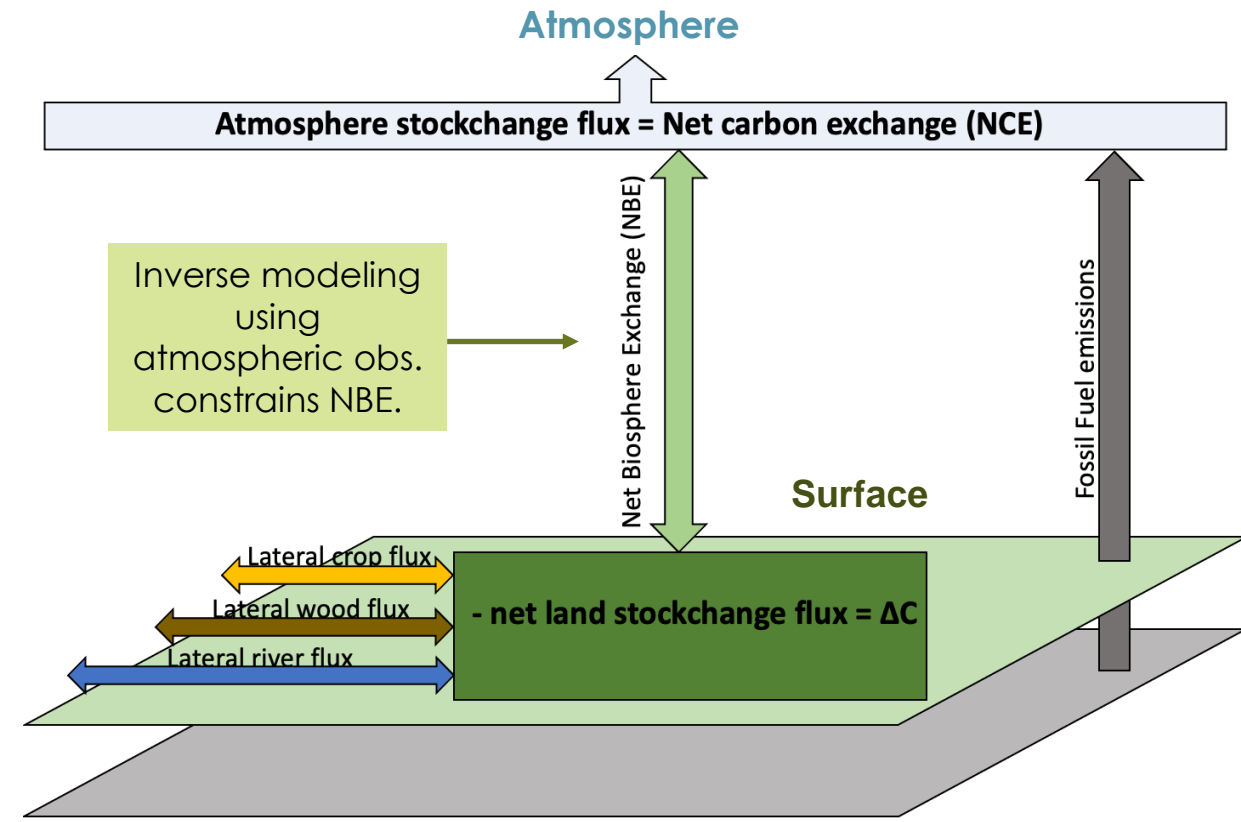

- Simulate atmospheric CO<sub>2</sub> using prior estimate of surface-atmosphere fluxes and realistic winds.
- Compare “measurement” of model atmosphere with real measurements.
- Correct flux estimates to make model atmosphere agree with real measurements, within uncertainties.

# Terminology

- **Net Biosphere Exchange (NBE):** Net flux of carbon between the terrestrial biosphere and the atmosphere, including biomass burning. Includes both anthropogenic processes (e.g., deforestation, reforestation, farming) and natural processes (e.g., climate-variability-induced carbon fluxes, disturbances, recovery from disturbances).
- **Fossil Fuel and Cement Emissions (FF):** The burning of fossil fuels and release of carbon due to cement production, representing a flux of carbon from the geologic reservoir to the atmosphere.
- **Terrestrial Net Carbon Exchange (NCE):** Net flux of carbon between the surface and atmosphere. For e.g., land NCE can be defined as:  $NCE = NBE + FF$

Schematic of NCE, NBE, and Other Carbon Fluxes

Adapted from [NASA's ARSET Training on Global Stocktake](#)

# Studies Conducted with Level 2, Level 3, or Level 4 Data

- What is the net CO<sub>2</sub> flux exchange between the land and atmosphere, or the ocean and atmosphere -
  - At global to continental scales
  - At regional scale, for e.g., South Asia
  - At country level scale, for e.g., US, Brazil, India, etc.
- How did the carbon cycle respond to –
  - The 2015 -2016 El Nino
  - The 2019-2020 bushfires in Southeast Australia
- What was the impact on atmospheric CO<sub>2</sub> concentrations due to the COVID-19 pandemic?

Global and Regional CO<sub>2</sub> Flux Exchange  
Between Land/Ocean and Atmosphere

# Net CO<sub>2</sub> Flux Exchange Between Land-/Ocean- Atmosphere

2015 NBE

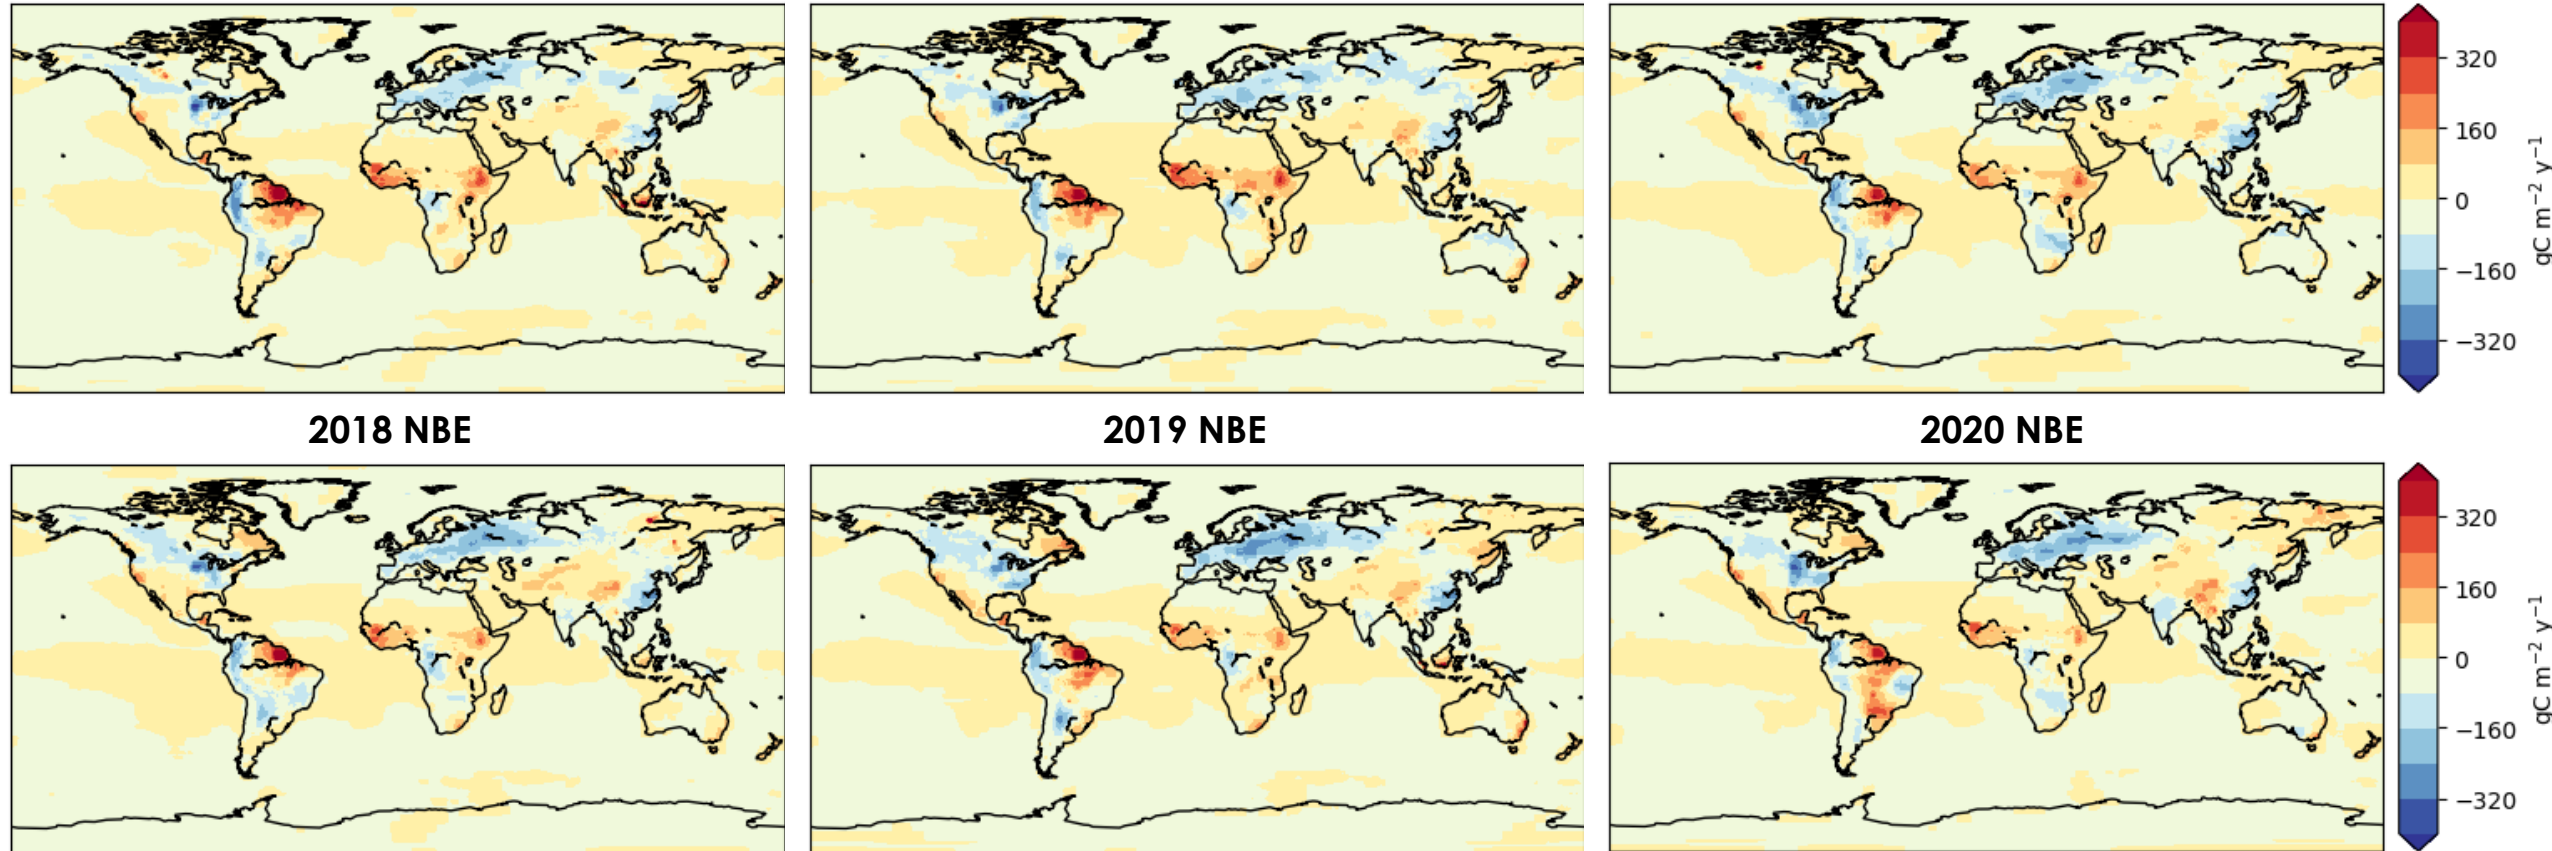

2016 NBE

2017 NBE

2018 NBE

2019 NBE

2020 NBE

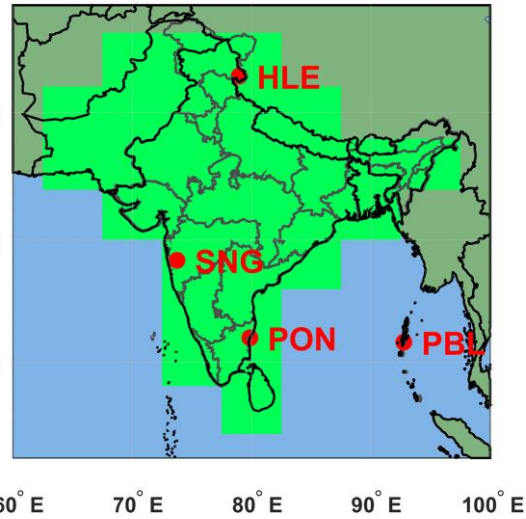

- **Blue** = Carbon uptake by the land and the ocean, **Red** = Carbon release by the land and the ocean
- Note the interesting action happening over the tropical land areas – we will revisit this shortly!
- OCO Science Team routinely generates these estimates – see Crowell et al. (2019), Peiro et al. (2022)

# What about CO<sub>2</sub> Flux Exchange at Regional Scales?

South Asia

- OCO-2 provides vital information over data-starved regions, such as South Asia, where we do not have many atmospheric CO<sub>2</sub> measurements from ground-based sites.
- CO<sub>2</sub> fluxes estimated from OCO-2 show lower annual sink but larger seasonal amplitude and a phase-shift in seasonality compared to estimates from the in-situ network.
- See Philip et al. (2022)

South Asia

# CO<sub>2</sub> Flux Exchange at Country Scales

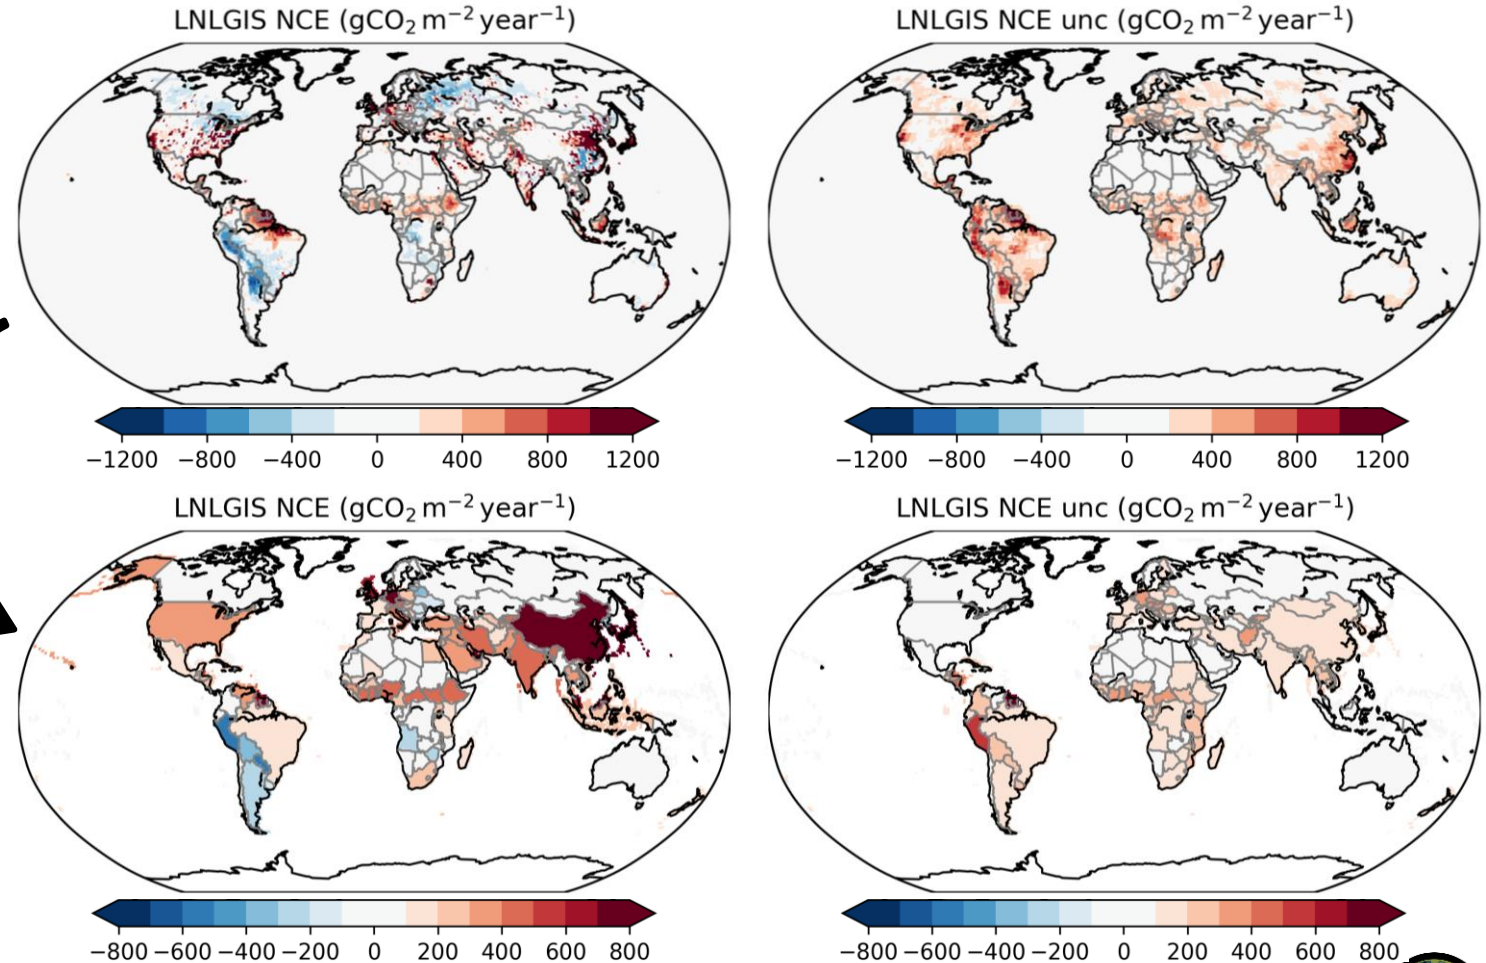

- One can estimate the **Net Carbon Exchange (NCE) = Fossil Fuel + Net Biosphere Exchange**
- Estimates provided on a 1° x 1° grid
- Aggregated to country totals
- See ARSET Training on [Global Stocktake](#) for significance of these estimates and maps

**NCE fluxes  
Aggregated to  
Country Totals**

## Net Carbon Exchange (NCE) for 2015–2020

Mean

Uncertainty

# Contribution to the UNFCCC Global Stocktake

## Global Top-Down CO<sub>2</sub> Budgets

- Pilot global CO<sub>2</sub> budgets derived from flux products being developed by the OCO-2 Model Intercomparison Project (OCO-2 MIP)
  - Combine in situ CO<sub>2</sub> measurements and column-averaged CO<sub>2</sub> dry air mole fraction (XCO<sub>2</sub>) estimates from OCO-2 to predict fluxes and stock changes

These top-down atmospheric CO<sub>2</sub> budgets complement bottom-up inventories to support a more complete, accurate, & transparent global stocktake (GST) as defined in:

- [Article 14 of the Paris Agreement](#)

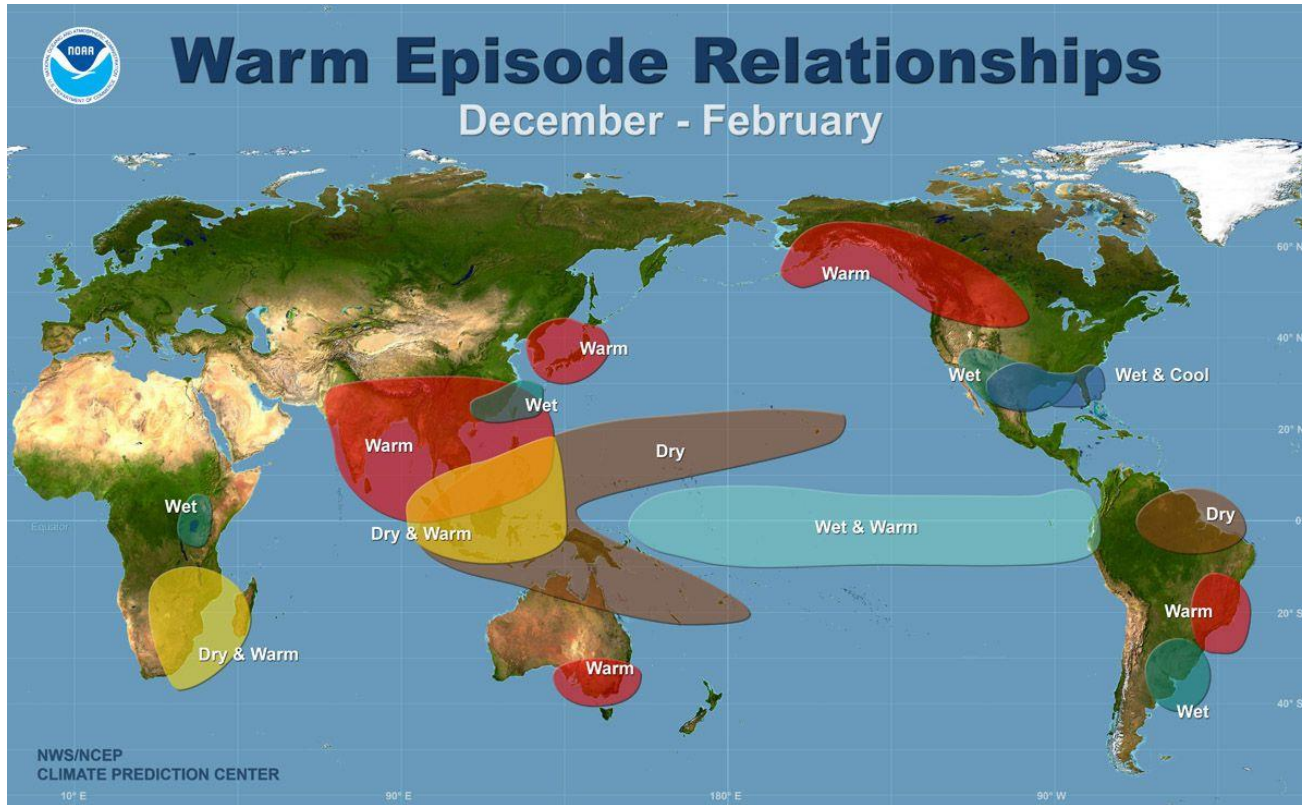

See ARSET Training on [Atmospheric CO<sub>2</sub> and CH<sub>4</sub> Budgets to Support the Global Stocktake](#)

## Carbon Cycle Response to Climate Patterns & Variability

# What is an El Niño ?

- a climate pattern that describes unusual warming of surface waters in the eastern tropical Pacific Ocean
- “warm phase” of a larger phenomenon called the El Niño-Southern Oscillation (ENSO)
- occurs irregularly at 2-7-year intervals
- impacts ocean temperatures, speed and strength of ocean currents, health of coastal fisheries, and weather from tropics to extra-tropics

For *attendees*: lots of great resources on the web, e.g.,  
[climate.gov/enso](https://www.climate.gov/enso),  
<https://www.pmel.noaa.gov/elnino/what-is-el-nino>

# Carbon Cycle Response to the 2015-2016 El Niño

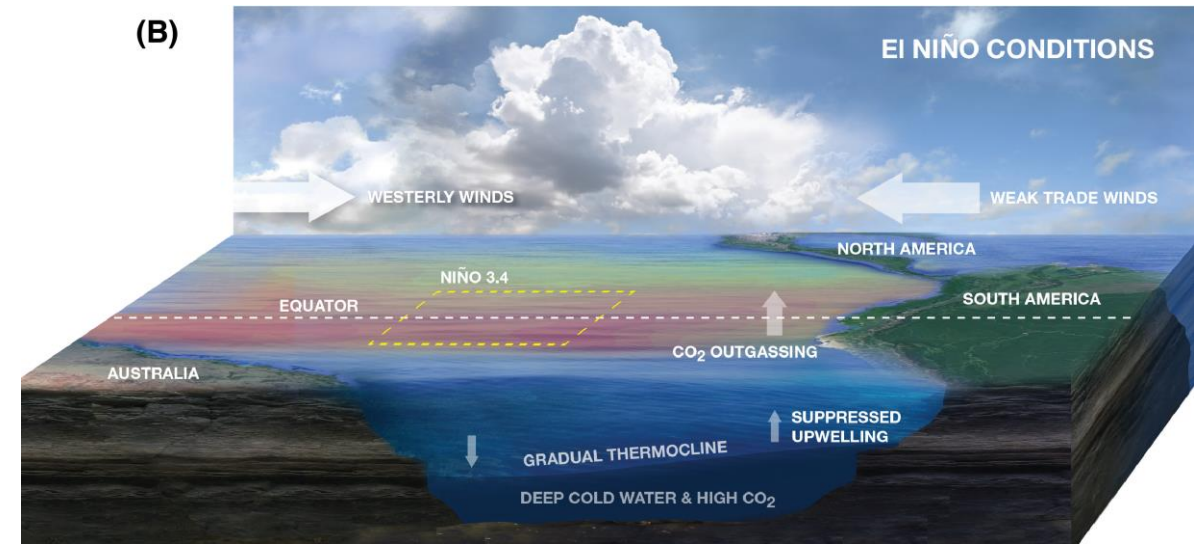

## Sea Surface Temperature Anomalies

- Correlations between atmospheric CO<sub>2</sub> growth rate and El Niño and La Niña activity have been reported since the 1970s – see [Chatterjee et al. \(2017\)](#).
- ENSO is a big driver of inter-annual variability in the carbon cycle. Studying the response of CO<sub>2</sub> to ENSO → how feedbacks between the physical climate system and global carbon cycle operate.
- Understanding causal mechanisms, especially separating the influence of the marine and the terrestrial components have been challenging due to limited observations over the Tropical Pacific and surrounding regions.

# Carbon System in the Tropical Pacific

- **Normal Conditions:** Upwelling of cold, sub-surface waters that have high potential  $p\text{CO}_2$  + inefficient biological pump → strong  $\text{CO}_2$  outgassing.
- **El Niño Conditions:** Deepening of thermocline, reduction in upwelling, weakening of trade winds + more efficient biological pump → decreases  $\text{CO}_2$  outgassing by 40-60%.

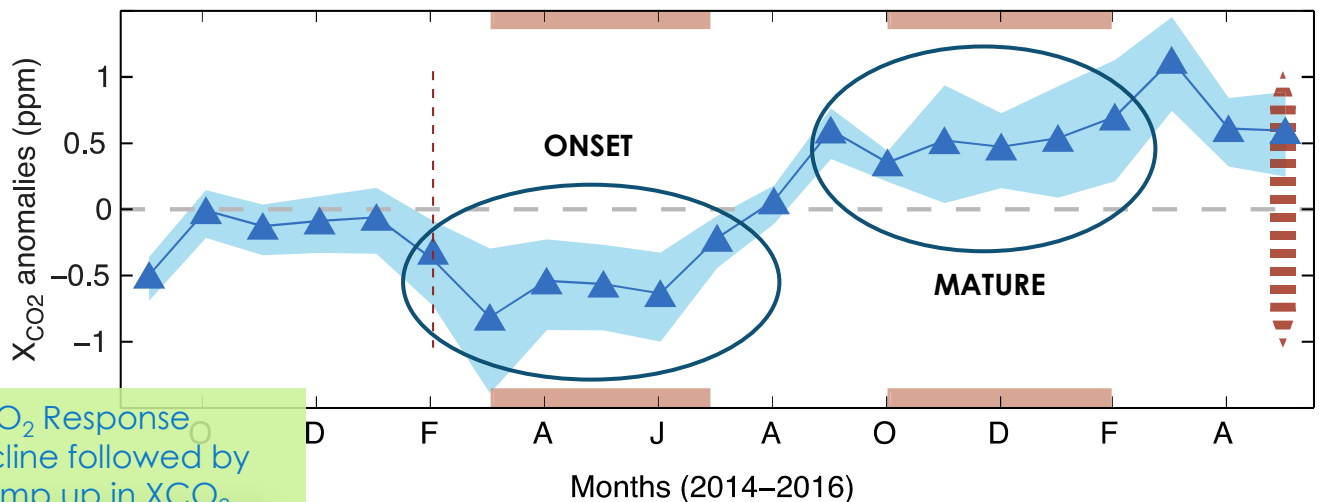

# Observable Trends During the 2015 – 2016 El Niño

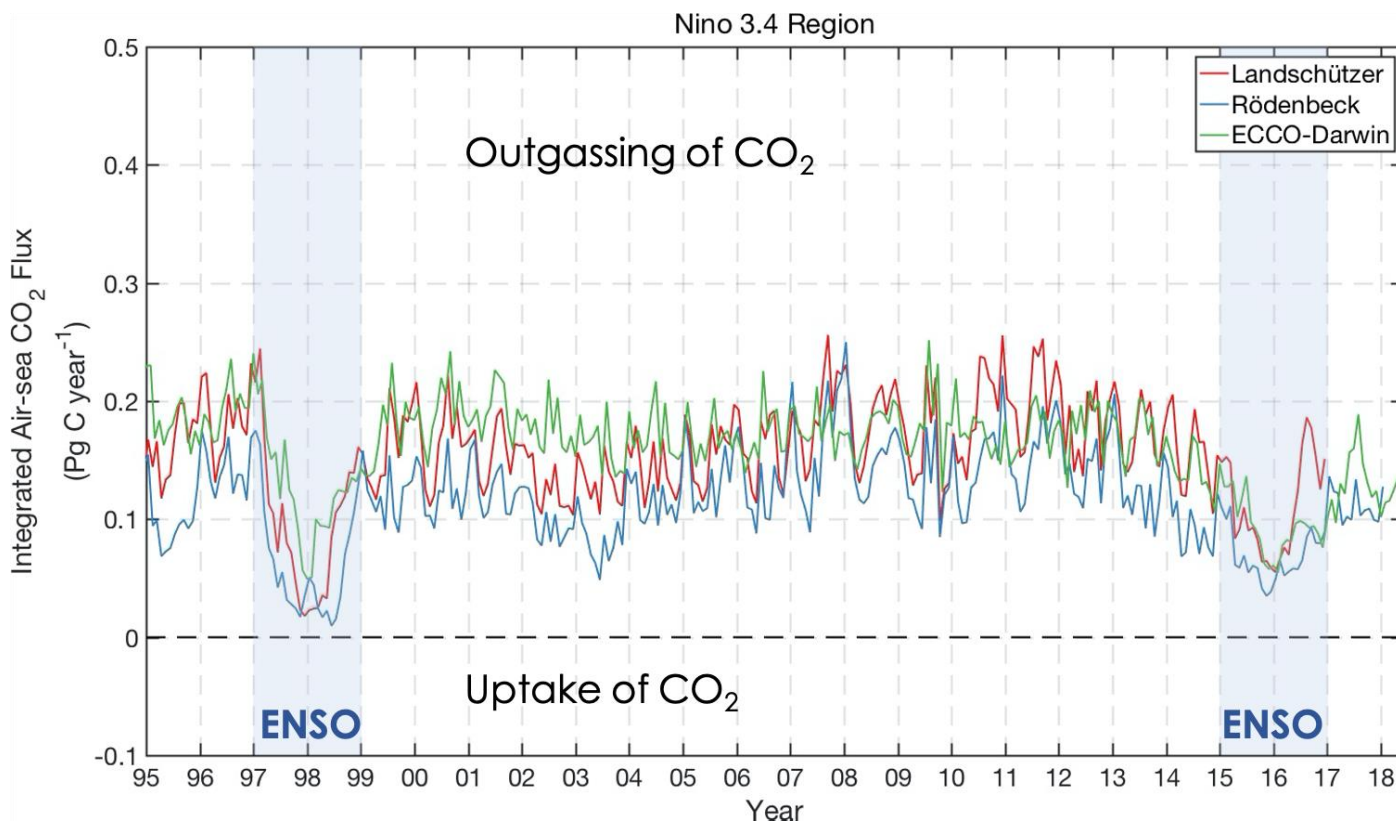

Time-series showing the temporal evolution of  $X_{CO_2}$  anomalies over Niño 3.4 region

Sep 2014 – May 2016

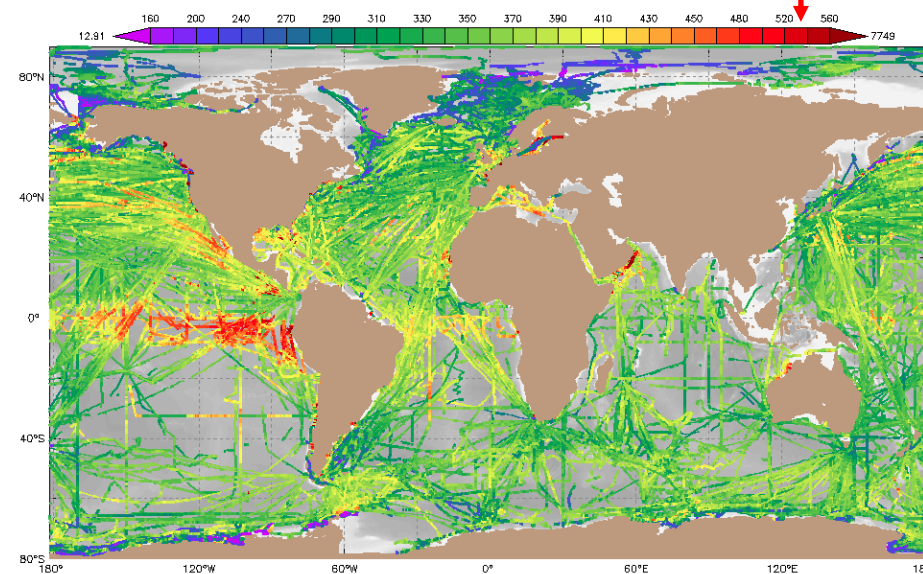

Chatterjee et al. [2017]

# Reduction in CO<sub>2</sub> Outgassing from the Tropical Pacific

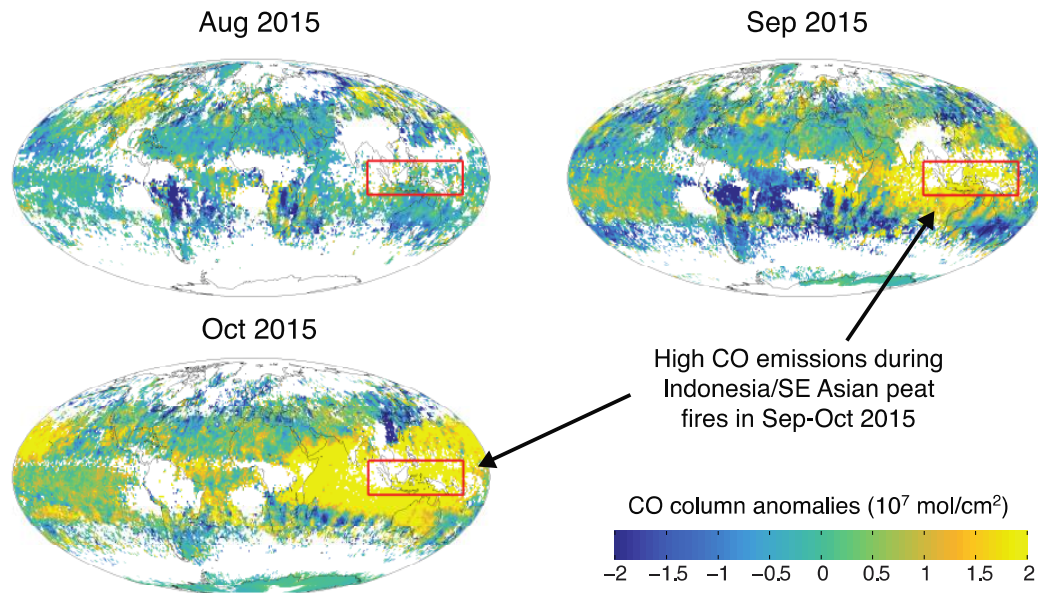

OCO-2-Based Flux Estimate (PgC)	Model Ensemble Mean (PgC yr <sup>-1</sup> )	PMEL Shipboard, Data-Based Estimate (PgC)
0.20 ± 0.07	0.12 ± 0.06	0.22 - 0.26

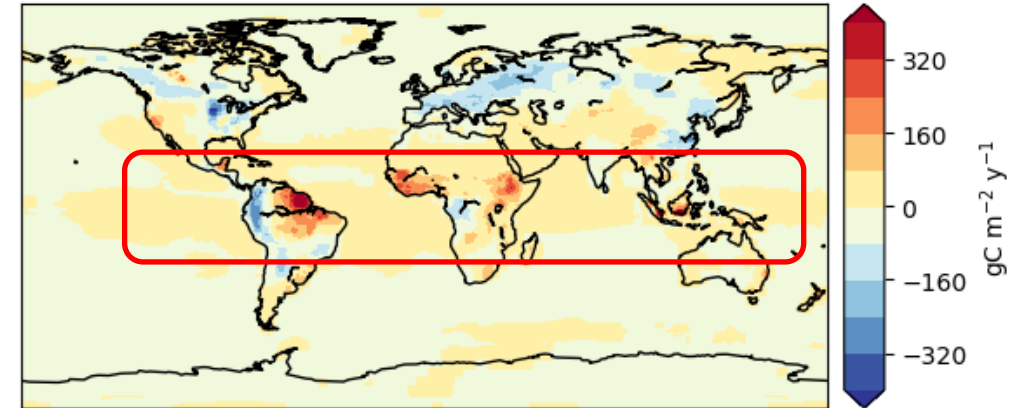

# What Caused the Increase in Atmospheric CO<sub>2</sub>?

## Changes in Tropical Land Fluxes

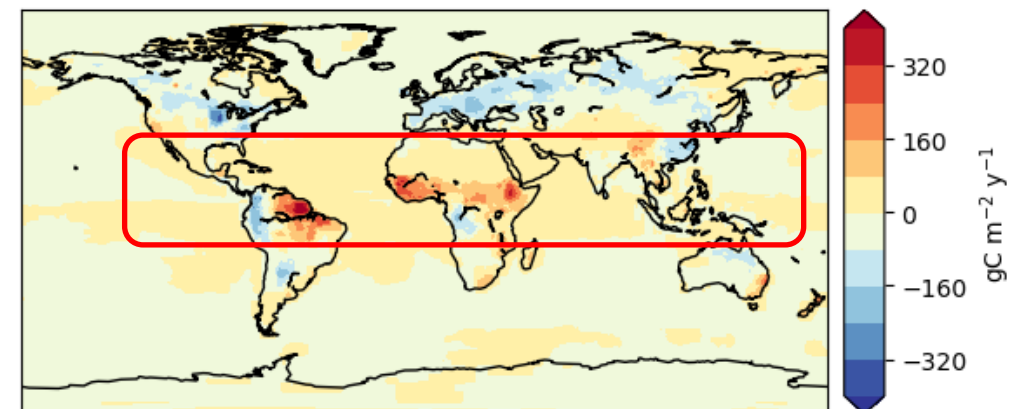

- Increase in emissions from biomass burning
- Warmer and drier climate across the Tropical lands – overall reduction in biospheric uptake

2015 Net Annual Flux (OCO-2)

2016 Net Annual Flux (OCO-2)

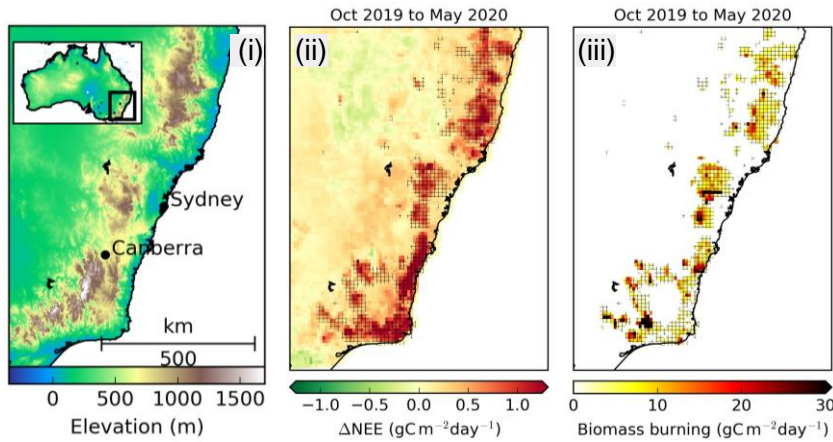

# Additional Reading on Unique Findings from OCO-2

- In 2017, we had a special issue in Science Magazine (Vol. 358, Issue 6360). OCO-2 provided the first and unique insights into El Niño's effects on CO<sub>2</sub> fluxes, detection of CO<sub>2</sub> emissions from point sources, and measurement of terrestrial photosynthesis.

# Carbon Cycle Response to 2019-2020 Bushfires in SE Australia

(a) Geography and maps of CO<sub>2</sub> flux anomalies

(b) Timeseries of prior (red) and posterior (blue) CO emissions

(c) Timeseries of GPP for 2019/20 and mean year

(d) Net annual NBE fluxes from 2010/11 to 2019/20

NASA Satellite Imagery from Dec. 2019

- 2019 was the hottest and driest year on record for Southeast Australia, leading to bushfires of unprecedented extent.
- See Byrne et al. (2021) for a detailed analysis using the OCO-2 data.
- Surface-atmosphere CO<sub>2</sub> flux anomalies due to extreme events can be tracked from space – in addition, we can use data from missions like OCO-2 and OCO-3 to quantify differences in carbon cycle responses between vegetation types and burned/unburned ecosystems.

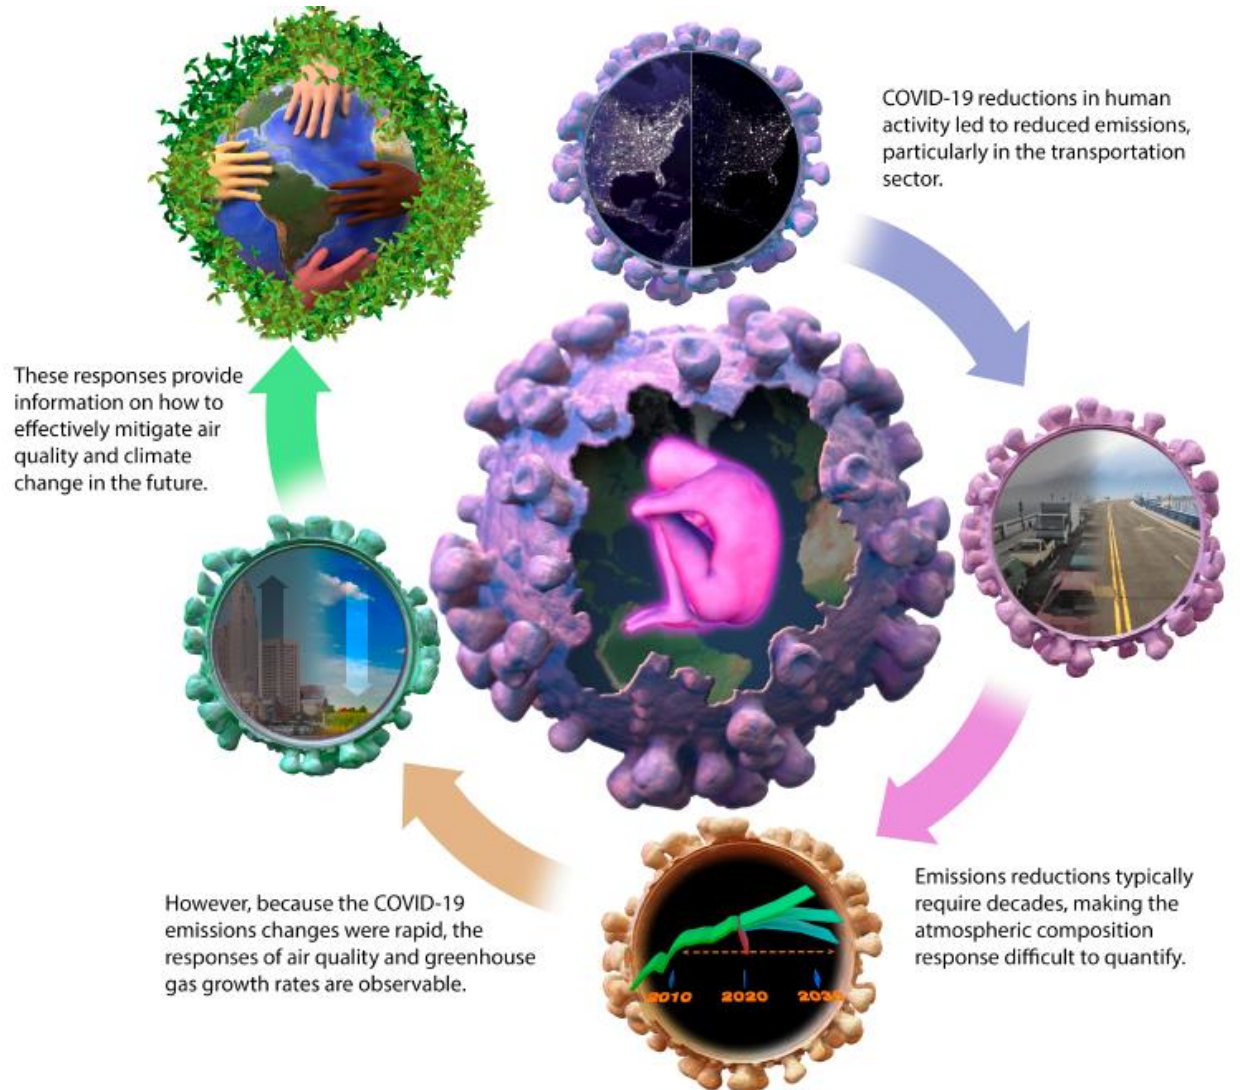

# Carbon Cycle Response to Anthropogenic Perturbations

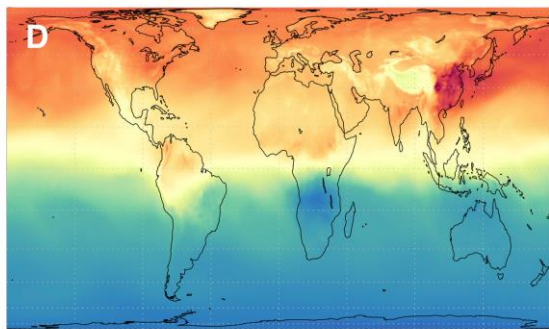

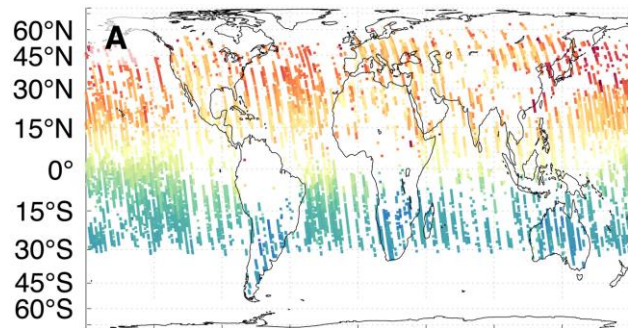

# COVID-19 Induced Reductions in Human Emissions Activity

- The COVID-19 pandemic and resulting limitations on travel and other economic sectors by countries around the globe drastically decreased air pollution and greenhouse gas emissions within just a few weeks.
- Emissions estimates for 2020 based on economic activity data suggested that, compared to 2019 emissions, daily global emissions decreased by as much as 15–20% in April 2020.
- Metrics for change in human activity at different scales show that the strongest impact of COVID-19 lockdowns were in the transportation sections, and that these impacts varied substantially from country to country.
- See Laughner et al. (2021).

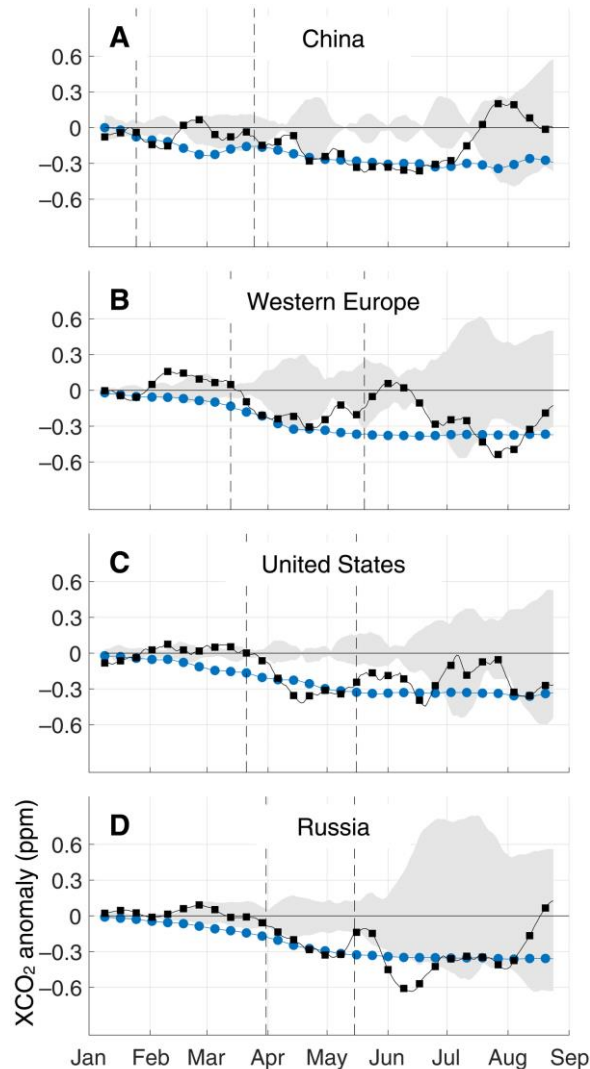

# Regional Reductions in CO<sub>2</sub> Concentrations Detected from Space

406 408 410 412 414 416 418 420

April 1–16, 2020 XCO<sub>2</sub> (ppm)

NASA's Applied Remote Sensing Training Program

XCO<sub>2</sub> anomaly (ppm)

2017–2019 analysis • 2020 FF-only sim.  
 —■— 2020 analysis

- Gap-filled 50-km XCO<sub>2</sub> fields (daily and monthly), which is produced by assimilating bias-corrected OCO-2 data into the GEOS Constituent Data Assimilation System (CoDAS).
- Starting in February 2020 and continuing through May 2020, column CO<sub>2</sub> over many of the world's largest emitting regions was 0.14 to 0.62 parts per million less than expected in a pandemic-free scenario, consistent with reductions of 3 - 13% in annual global emissions.
- Anomaly and concentration maps available on trilateral (NASA/ESA/JAXA) Earth Data Dashboard – <https://eodashboard.org/covid-19>
- See Weir et al. (2021).

# The Full COVID-19 and Carbon Cycle Story is Highly Nuanced

- Satellite monitored changes in early 2020 XCO<sub>2</sub> due to the COVID-19 pandemic were small (0.14–0.62 ppm), negative, and consistent with country-level activity data.
  - The US, Europe, and East Asia saw the most noticeable reductions.
  - However, at global and annual scales, we can't distinguish the signal from natural CO<sub>2</sub> variability.
- Ocean and land compartments had reduced uptake in 2020.
  - The COVID-like emissions reduction signal in the atmospheric carbon reservoir may have been detectable above the noise of internal variability for at least 2-3 consecutive years, if not for the slowing ocean and land carbon sink.

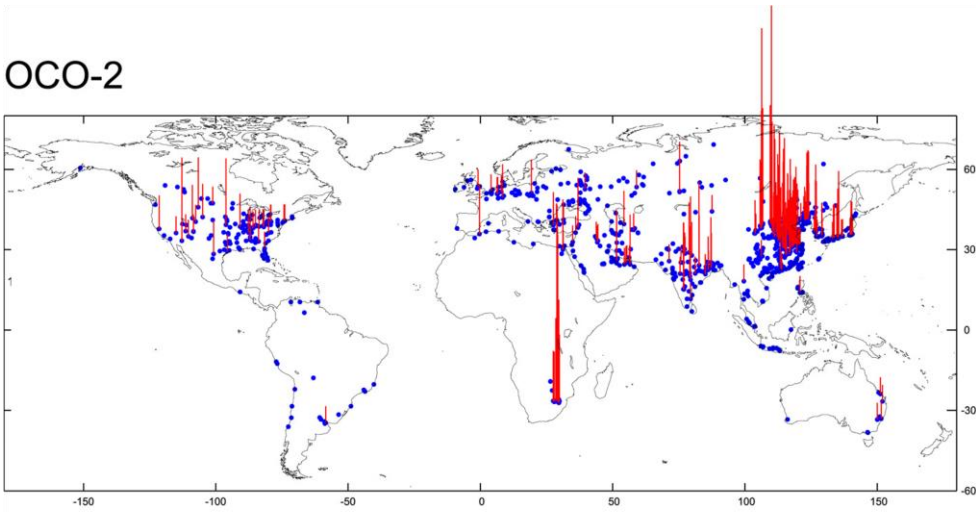

Response of the 3 Major Carbon Reservoirs and their Recovery Post-Pandemic

See Lovenduski et al. (2021)

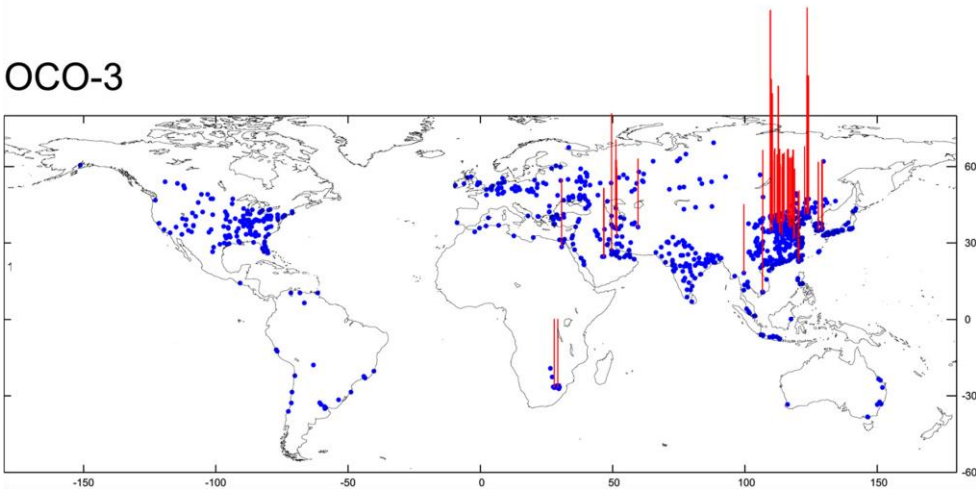

# CO<sub>2</sub> Emitters from Large Point Sources can be Seen from Space

OCO-2

OCO-3

See Chevallier et al. (2022)

- OCO-2 and OCO-3 observe emission plumes from large point sources - in the wake of the Paris Climate Agreement, there is an increasing need to monitor emissions from fossil fuel combustion around the world.
- Blue dots represent global locations, where emissions exceed 1.0 ktCO<sub>2</sub> h<sup>-1</sup>. Red impulses on these maps illustrate the number of times when retrieved emissions are attributed to these cells for OCO-2 (top) and OCO-3 (bottom).
- OCO-2 and OCO-3 explain a large part of the variability seen in a global emission inventory (EDGAR).

# Other Urban and Local Emission Studies

- Next Training – Session 4 (June 2) - **Understanding Urban Carbon Emissions with Space-Based Carbon Dioxide Observations**

OCO-3 SAM Mode Coverage Over the Los Angeles Megacity

**Credit:** NASA Earth Observatory/NOAA NGDC

## Summary

# Wrap-Up: What have we learned?

- CO<sub>2</sub> monitoring from space is becoming an increasingly important and relevant capability in support of climate studies and to inform policy decisions.
  - However, native Level 2 XCO<sub>2</sub> data often have missing soundings.
  - The scientific community uses Level 3 (gap-filled XCO<sub>2</sub> product) and Level 4 (information about emissions and removals of CO<sub>2</sub>) for the majority of global and regional studies.
- CO<sub>2</sub> flux estimates derived from XCO<sub>2</sub> are used to constrain net biosphere exchange (NBE) and net carbon exchange (NCE) between the land and ocean surfaces & the atmosphere.
  - These estimates are providing valuable information to the UNFCCC Global Stocktake process.
- XCO<sub>2</sub> data also provides unique insights into global and regional carbon cycle processes and how those respond to various forcings, natural (climate patterns) and anthropogenic perturbations (emission changes).
  - 2015 - 2016 El Niño and the COVID-19 pandemic are classic case studies that demonstrate how we can use XCO<sub>2</sub> data to advance our geophysical understanding of carbon cycle science.
