Trace Gas Air Quality Products from OMI and TROPOMI

Melanie Follette-Cook and Pawan Gupta

Application of Satellite Observations for Air Quality and Health Exposure, Oct 9 and 11, 2019

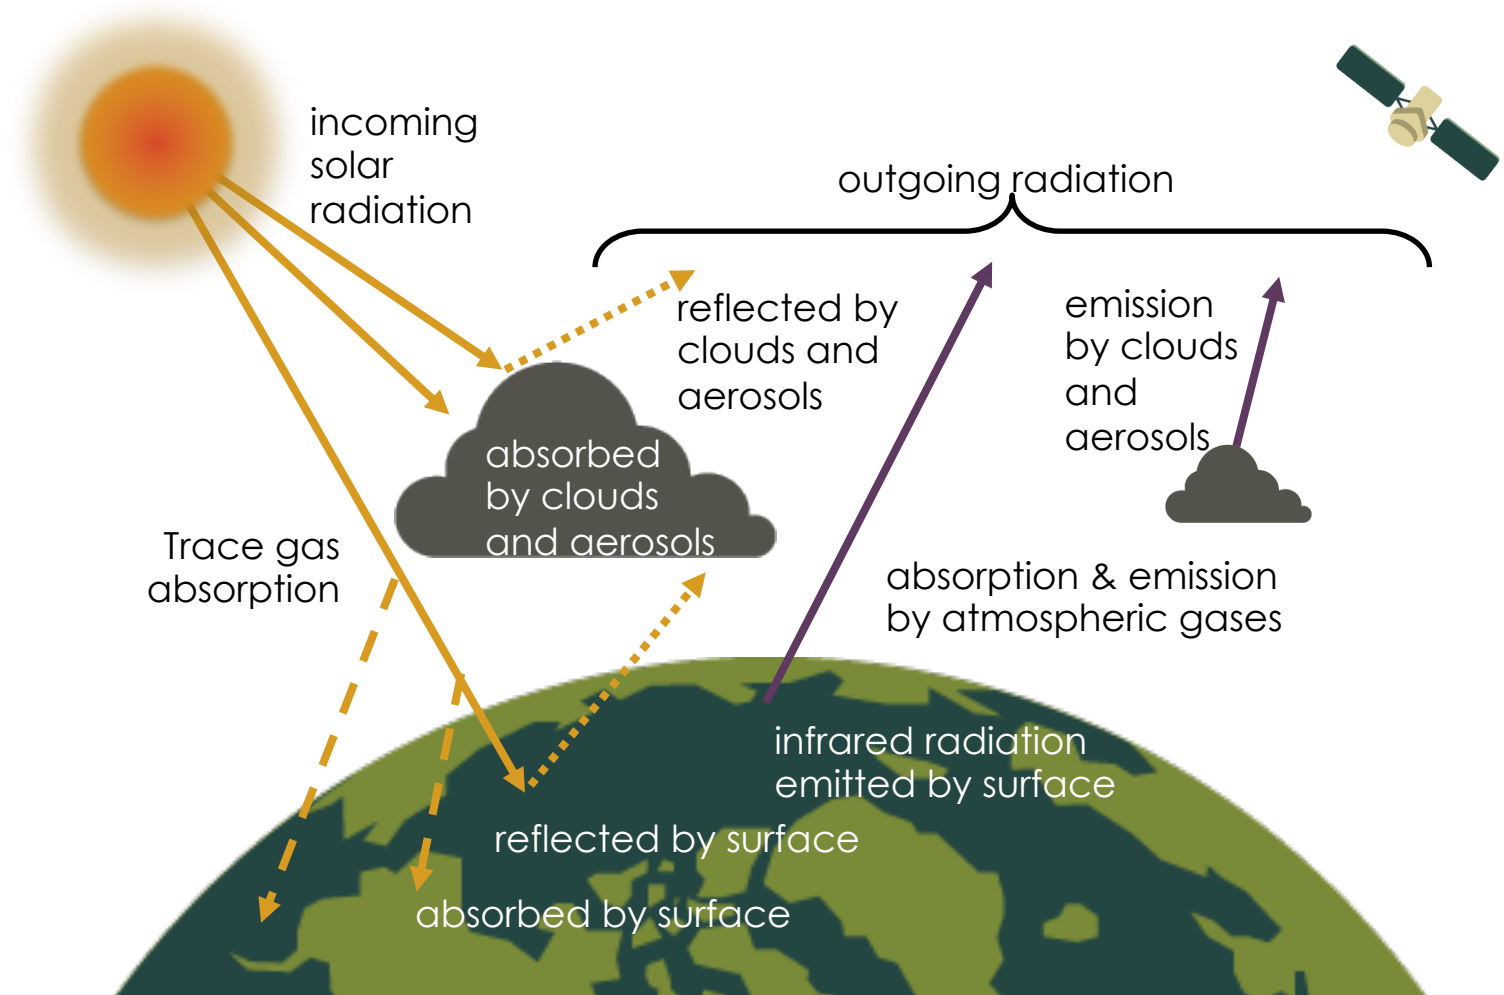

Learning Objectives

By the end of this presentation, you will be able to:

- Describe existing satellite capabilities for global observations of several trace gases
- Describe current data products available from the Ozone Monitoring Instrument (OMI) and the TROPOspheric Monitoring Instrument (TROPOMI)
- Identify various air quality monitoring applications utilizing OMI NO₂ observations
- Identify where and how to download OMI and/or TROPOMI data

What do Satellites Measure?

- Remote sensing: collecting information about an object without being in direct physical contact with it
- The intensity of reflected and emitted radiation to space is influenced by the surface and atmospheric conditions
- Satellite measurements contain information about the surface and atmospheric conditions

Measuring Trace Gases from Space

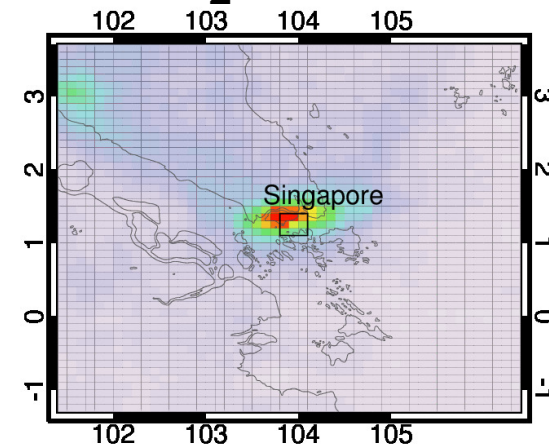

- Satellites detect backscattered UV, visible, and/or emitted thermal radiation
- We know the distinct absorption spectra of each trace gas
- We can identify a “spectral fingerprint” for each atmospheric constituent
- Retrieval algorithms (a model) infer physical quantities such as number density, partial pressure, and column amount

Vertical Distribution

- Very little information can be obtained on the vertical distribution of trace gases in the troposphere from a nadir view
- Some information on vertical distribution can be inferred by taking the altitude of the trace gas source and its lifetime into account
- Examples:
 - NO₂ is short-lived and primarily emitted from fossil fuel combustion (e.g., cars, power plants), so most NO₂ is found near the surface

OMI NO₂ (x10¹⁵ molec/cm²)

Data Formats & Resolutions

Data Level	Description
Level 0	Raw data at full instrument resolution
Level 1A	Raw data that have been time-referenced and supplemented with information such as radiometric and geometric calibration coefficients and geo-referencing parameters. These are computed and appended, but not applied to Level 0 data.
Level 1B	Level 1A data that has been processed to sensor units (not all instruments have Level 1B source data)
Level 2	Derived geophysical variables at the same resolution and location as Level 1 source data
Level 2G & 3	Variables mapped on uniform space-time grid scales, usually with some completeness and consistency
Level 4	Model output or results from analyses of lower level data (e.g. variables derived from multiple measurements)

Trace Gases: Using Level 3 vs. Level 2 Data

- Advantages
 - Uniform grid
 - One file per day
 - Smaller sized files
 - Quality flags and filtering criteria have been applied
- Limitations
 - Can be coarser resolution than L2
 - L2 observation typically at the same location as the L1 source data

Spatial Resolution: Trace Gases

- Spatial resolution of current satellite instruments (10s to <10 km diameter)
 - good enough to map tropospheric concentration fields on local to regional scales
 - fine enough to resolve individual power plants and large cities
- For species with short atmospheric lifetimes (e.g. NO_2), averaging over larger satellite pixels can lead to significant dilution of signals from point sources, complicating quantitative analysis and separation of emission sources
- For quantitative analysis: Level 2 and high resolution gridded Level 3 data are optimal

Perspective...

Spatial Resolution

OMI 24x13 km²

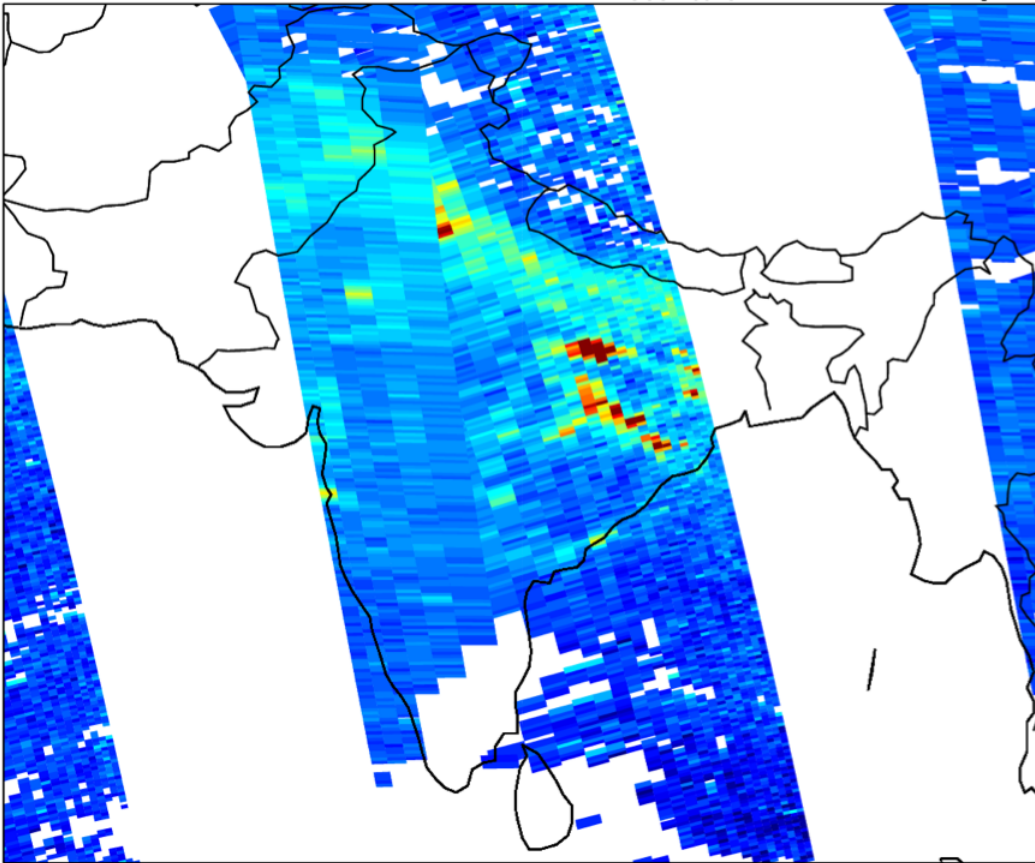

Approx. GOME-2 72x39 km²

Mexico City, Jan. 20, 2005

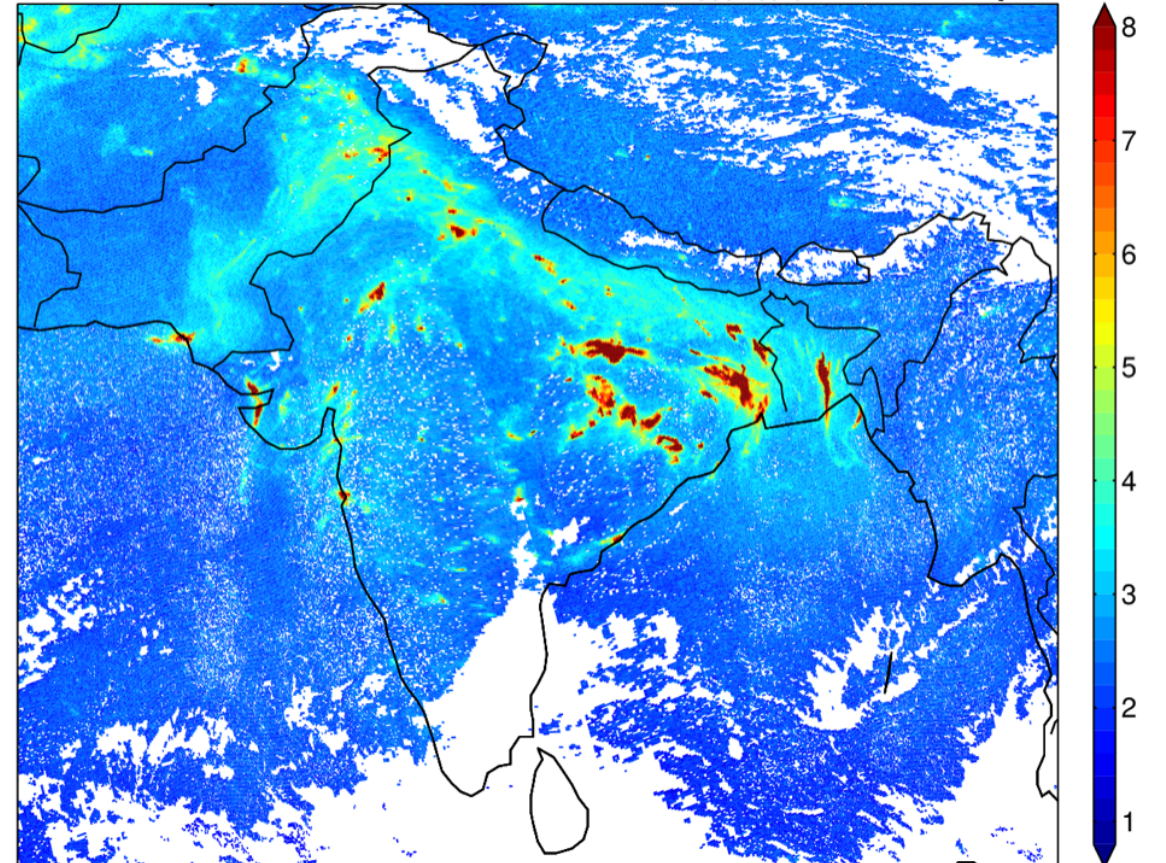

TROPOMI: Impact of Resolution

November 28, 2017

OMI NO₂

TROPOMI NO₂

Spatial Resolution = 3.5 x 7.0 km²

Temporal Variations

- Satellite observations can also be used to detect potential short term and unexpected changes in trends, such as reductions in activity due to:
 - economic recession
 - natural disasters (e.g., Hurricane Katrina)
 - policy interventions (e.g., Beijing Olympics)
 - civil unrest

NO₂ Trends from OMI
Damascus: $-37.1 \pm 10.9\%$
Aleppo: $-40.2 \pm 13.6\%$

Temporal Variations

- Examine finer temporal emissions cycles
 - Weekly cycles
 - Seasonal cycles of different sources
 - Anthropogenic – Winter
 - Soil – Summer
 - Biomass Burning – Dry Season

Estimating Surface NO₂ From the Tropospheric Column

Satellites measure backscattered radiation, from which vertical column densities can be calculated

Courtesy of Randall Martin

Estimating Surface NO₂ From the Tropospheric Column

$$v = \frac{\Omega_{Satellite}}{\Omega_{Model}}$$

$$S = \Omega_{Sat} \times \left[\frac{v S_{Model}}{v \Omega_{Model} - (v - 1) \Omega_{FT} (Model)} \right]$$

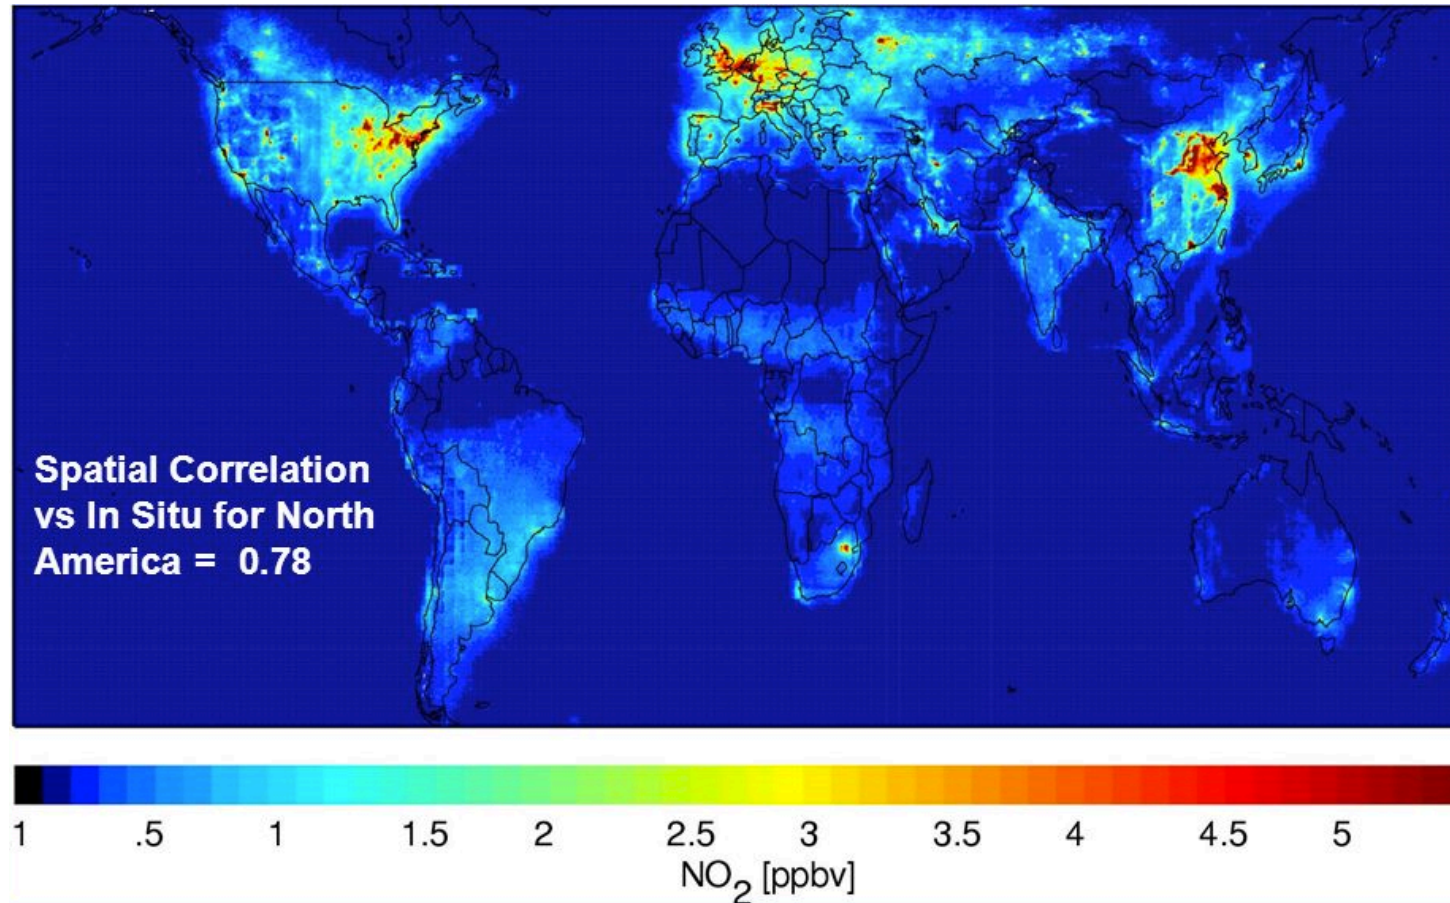

Lamsal et al. (2008)

Use vertical information from an atmospheric chemistry model to estimate the relationship between the column and the surface

S = Surface Concentration
Ω = Tropospheric Column
FT = Free Troposphere

Satellite-Derived Surface NO₂ Used in Health Applications

- Anenberg et al. (2018) used annual average surface NO₂, along with annual average PM_{2.5} and annual average ozone from a model
- Used to estimate the number of global asthma-related emergency room visits due to PM_{2.5}, O₃, and NO₂ exposure
- Noted that NO₂ impacts are likely underestimated because of the relatively coarse OMI resolution

Global Pollution Monitoring Constellation (2020-2022)

Policy-relevant science and environmental services enabled by common observations

- Improved emissions over industrialized Northern Hemisphere
- Improved air quality forecasts and assimilation systems
- Improved assessment, e.g., observations to support the United Nations Convention on Long Range Transboundary Air Pollution

OMI and TROPOMI

OMI vs TROPOMI

OMI		TROPOMI
Aura	Satellite	Sentinel-5P
July 2004	Launched	Oct 2017
nadir-viewing imaging spectrometer	Instrument	nadir-viewing imaging spectrometer
264 – 504 nm (UV/VIS)	Spectral Range	270 nm – 2.3 μ m (UV/VIS/NIR/SWIR)
0.42 – 0.63 nm	Spectral Resolution	0.55 nm
13x24 km ² at nadir	Spatial Resolution	7 x 3.5 km ² 7 x 28 km ² (UV1 band) 7 x 7 km ² (SWIR bands)
Daily	Global Coverage	Daily

Spatial Resolution

OMI Tropospheric Column NO₂

tropospheric vertical column of nitrogen dioxide (10^{15} molecules cm^{-2})

Data Min = -8, Max = 39

TROPOMI Tropospheric Column NO₂

tropospheric vertical column of nitrogen dioxide (10^{-6} mol m^{-2})

Data Min = -15403, Max = 1582

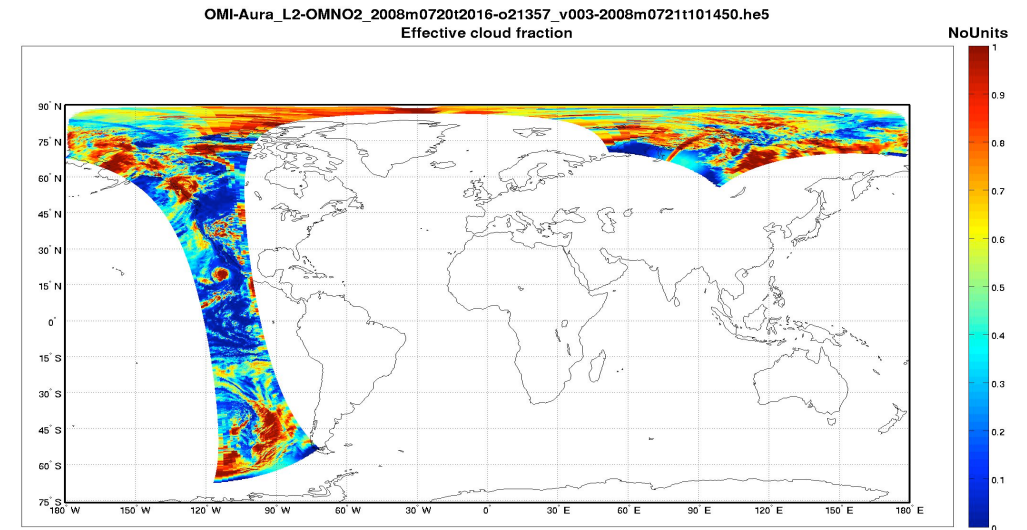

Sentinel-5 Precursor and the upcoming Sentinels for monitoring atmospheric Composition. (2018, October). Presented at the CAMS 3rd General Assembly, Lisbon, Portugal. Retrieved from https://atmosphere.copernicus.eu/sites/default/files/2018-11/2_Zehner_S5p_CAMS_18.pdf

Similar measurement strategies

Data Granule

- Product File
 - covers sunlit portion of the orbit with an approx. 2,600 km wide swath
 - contains 60 binned pixels or scenes per viewing line
- 14 or 15 granules are produced daily, providing fully contiguous coverage of the globe

Effect of the OMI Row Anomaly

- Began in 2007 with only two rows
- Grew until 2012, at which point was affecting almost 50% of the data
- Affects all OMI products

OMI Tropospheric Column NO₂

Products from OMI vs TROPOMI

OMI		TROPOMI	
Tropospheric and Total Column NO ₂	Swath, gridded (0.25° and 0.1°)	Total Column NO ₂	Swath (7 km x 3.5km)
Total Column SO ₂	Swath, gridded (0.25°)	Total Column SO ₂	Swath (7 x 3.5 km)
Aerosol Index	Swath	Aerosol Index	Swath (7 x 3.5 km)
Total Column HCHO	Swath, gridded (0.1°)	Total Column HCHO	Swath (7 x 3.5 km)
Tropospheric and Total Column O ₃	Gridded (0.25°)	Tropospheric and Total Column O ₃	Swath (7 x 3.5 km)
		Aerosol Layer Height	Not released
		Carbon Monoxide (CO)	Swath (7 km x 7 km)
		Methane (CH ₄)	Swath (7 km x 7 km)

Data Access

NASA – Earthdata
<https://earthdata.nasa.gov/>

The screenshot shows the NASA Earthdata website. At the top, there is a navigation bar with the Earthdata logo and the text "Powered by EOSDIS". Below the navigation bar is a search bar with the text "Search datasets, news, articles, and information". The main content area features a world map with several green location markers. At the bottom of the map area, there are six circular icons representing different data categories: Atmosphere, Calibrated Radiance & Solar Radiance, Cryosphere, Human Dimensions, Land, and Ocean. Below the map area, there is a blue banner with the text "ACCESS NASA EARTH SCIENCE DATA" and two green buttons labeled "FIND DATA" and "VISUALIZE DATA".

ESA – Copernicus Open Access Hub
<https://scihub.copernicus.eu/>

The screenshot shows the Copernicus Open Access Hub website. At the top, there is a navigation bar with the Copernicus logo and the text "Copernicus Open Access Hub". Below the navigation bar is a dark blue banner with the text "Welcome to the Copernicus Open Access Hub". The main content area is divided into several sections. On the left, there is a text block that reads: "The Copernicus Open Access Hub (previously known as Sentinels Scientific Data Hub) provides complete, free and open access to Sentinel-1, Sentinel-2, Sentinel-3 and Sentinel-5P user products, starting from the In-Orbit Commissioning Review (IOC). Sentinel Data are also available via the Copernicus Data and Information Access Services (DIAS) through several platforms." Below this text is a blue book icon and a link to the "User Guide". On the right, there is a "Reports & Stats" section with a dark blue header. It displays "Data updated hourly" and two statistics: "38,463 prod. published in the last 24h" and "139,076 downloads in the last 24h". Below the statistics is a "Reports" section with a bar chart icon. At the bottom of the page, there is a row of five blue buttons labeled "Open Hub", "API Hub", "S-3 Pre-Ops", "S-5P Pre-Ops", and "GNSS Hub".
