C-HARM: Community needs, development, and operations

- I. Rationale for a predictive capability for domoic acid
- II. Development of the model tool
- III. C-HARM demonstration and public web portal for end-users
- IV. Assessing model performance (i.e. validation)
- V. Crossing the “Valley of Death” to an operational environment; opportunities for development in other regions?

Why predict HABS in California?

- Domoic acid (DA), from *Pseudo-nitzschia* blooms, is the **leading HAB issue on the U.S. West Coast...but is now expanding to the East Coast!**
- **Unprecedented West Coast-wide HAB of 2015 closed Dungeness Crab Fishery** for the season; contributed to **Unusual Mortality Events** of sensitive and protected species
- Shellfish growers, fishermen, and marine mammal rescue groups want an early warning system that will **enable mitigation efforts and resource management**

INITIAL BASELINE FOR MANAGEMENT/DECISION-MAKING

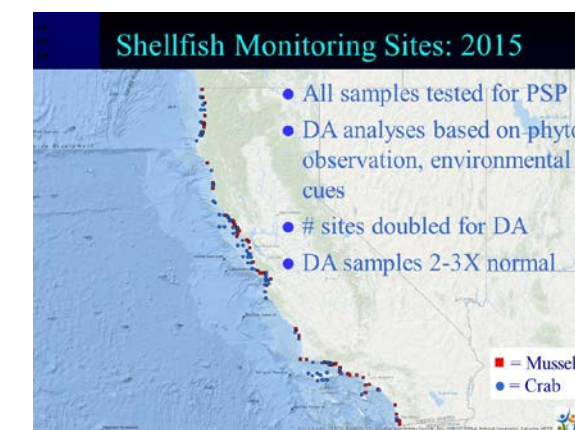

- CA Department of Public Health monitors for DA if the diatom is present at high abundance in the water
- Relies on fixed quarantine periods

Lewitus et al. 2012

CA Dept of Public Health

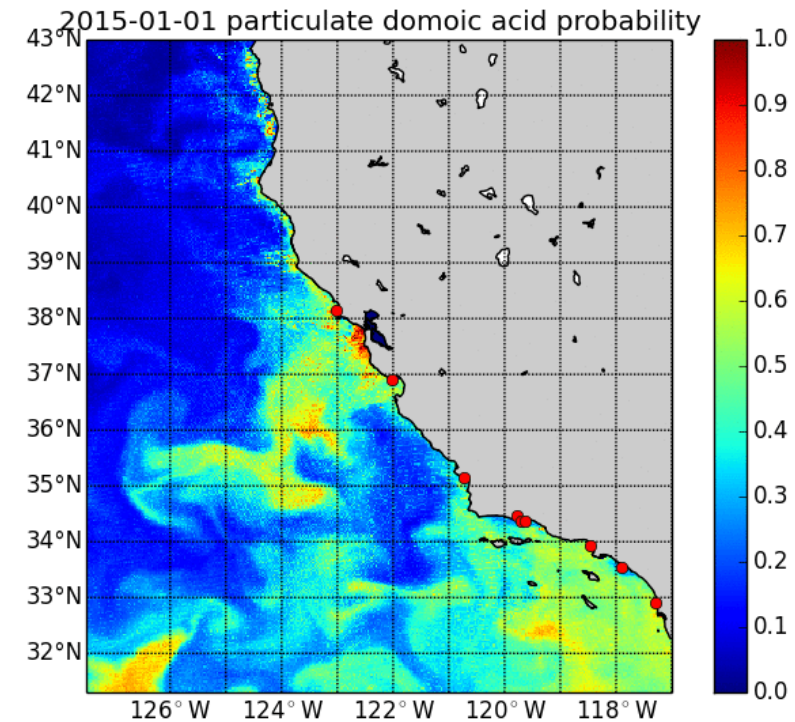

California Harmful Algae Risk Mapping System

Generalized Linear Models – based on logic regression

HAB Variable (Threshold)	Best-fit Logistic GLM $P_{\text{bloom}} = e^{(\lambda)} / [e^{(\lambda)} + 1]$	
<i>Pseudo-nitzschia</i> (10^4 cells mL^{-1})	$\lambda = 17.0 - 6.18[R_{rs} (510/555)] - 0.237[\text{Si(OH)}_4:(\text{NO}_3+\text{NO}_2)] - 0.482(\text{Month}) - 0.225[\text{Si(OH)}_4:\text{PO}_4] - 1266[R_{rs} (510)]$	
DOMOIC ACID	pDA (500 ng L^{-1})	$\lambda = -154.2 + 0.145[\text{Chl}] - 0.968[\text{Si(OH)}_4:(\text{NO}_3)] - 0.619(\text{Temp}) + 4.92(\text{Sal}) - 0.555(\text{NO}_3)$
	cDA (10 pg cell^{-1})	$\lambda = 10.7 - 0.618(\text{Temp}) - 0.659[\text{Si(OH)}_4] - 767[R_{rs} (510)]$

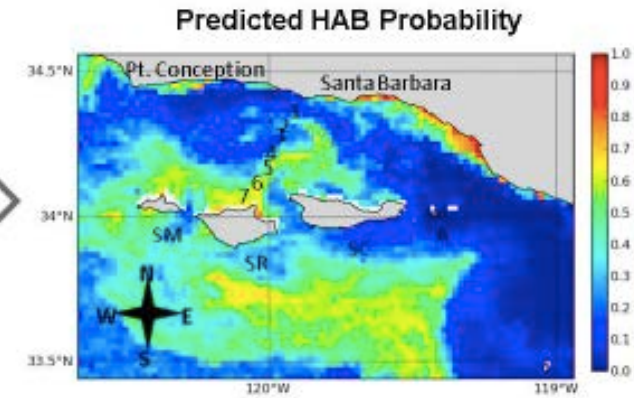

BUT..... we cannot easily acquire these nutrient data in real time or remotely
 THUS... we cannot use these models for routine forecasting of DA event likelihood

ALTERNATIVE APPROACH: Build models using conditions that are related to nutrient physiology of organism but that can also be detected remotely

Regional Ocean Model System (ROMS) for physical parameters

VIIRS/Suomi NPP is now online!

HAB Variable (Threshold)

Best-fit Logistic GLM - RS

$$P_{\text{bloom}} = \frac{e^{(\text{logit})}}{e^{(\text{logit})} + 1}$$

Pseudo-nitzschia
(10^4 cells mL^{-1})

(i)

$$\text{logit} = 8.54 + 10.84 \cdot [R_{rs}(510/555)] - 0.216 \cdot [\text{Month}] + 4.67 \cdot [R_{rs}(490/555)]$$

(ii)

$$\text{logit} = 5.32 - 2.87 \cdot [R_{rs}(490/555)] - 0.165 \cdot [\text{Month}]$$

pDA
(500 ng L^{-1})

$$\text{logit} = -134.3 + 0.253 \cdot [\text{Chl}] + 4.0 \cdot [\text{Sal}] - 502 \cdot [R_{rs}(555)]$$

cDA
(10 pg cell^{-1})

$$\text{logit} = -90.0 - 0.35 \cdot [\text{Temp}] - 666 \cdot [R_{rs}(555)] + 2.87 \cdot [\text{Sal}]$$

Silicic Acid

In order to run in near real-time, we have to deal with cloudy satellite imagery

Data Interpolating Empirical Orthogonal Functions (DINEOF)

Statistical reconstruction of satellite data solving spatial and temporal Empirical Orthogonal Functions simultaneously (Beckers & Rixen, 2003)

This is an open source method for statistically “filling” in gaps in the data, akin to Optimal Interpolation. Relies on the spatial variability inherent in the dataset for the time slice that you feed to the program.

Blue: MODISA DINEOF
Red: NDBC Buoy

(NDBC 46054 West Santa Barbara)

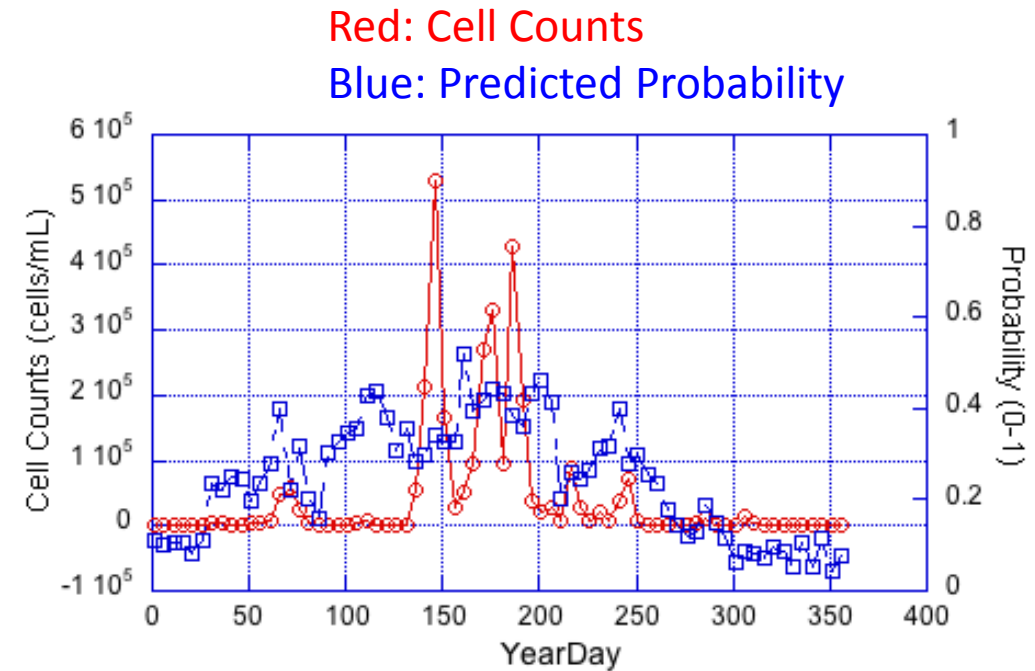

- SST: $R^2=0.9$, RMSE (Root Mean Square Error) $< 1^\circ\text{C}$, as good as Pathfinder AVHRR but daily!

Hindcasting *Pseudo-nitzschia* Blooms

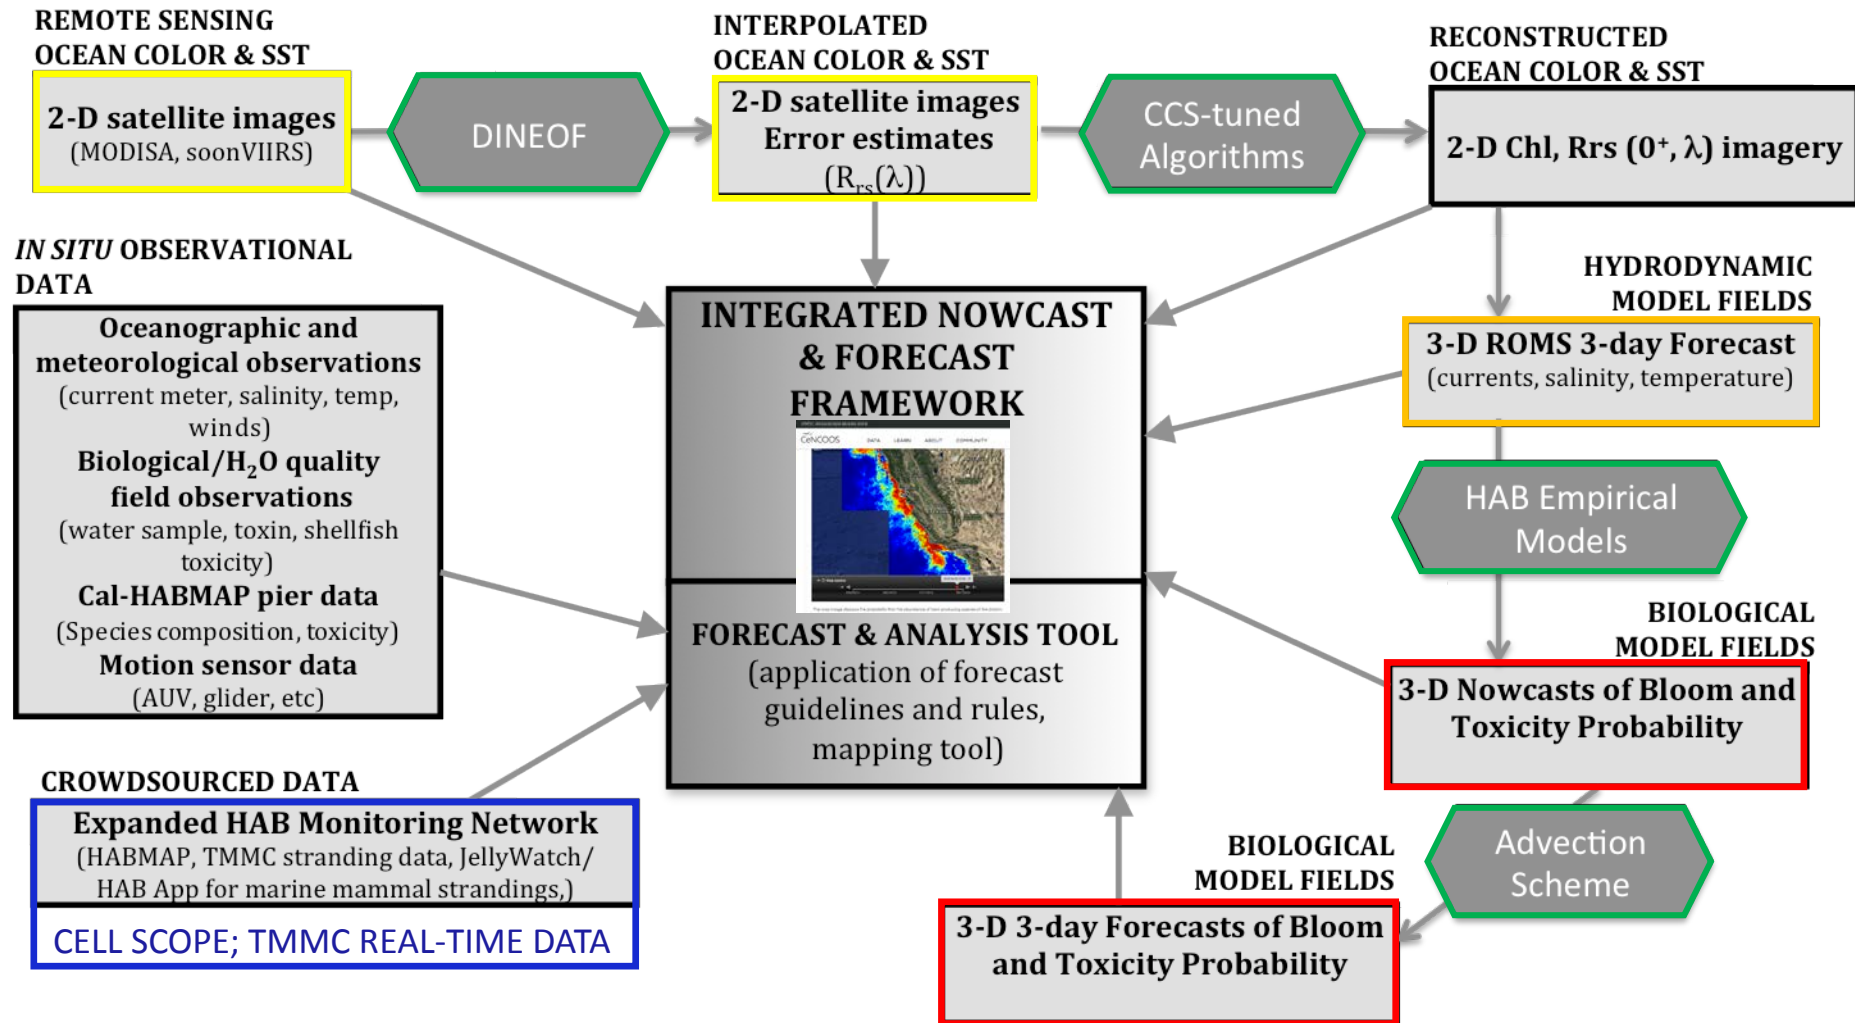

Probability (0-1) of *Pseudo-nitzschia*,
5-day intervals, 2009

- Focus on 2009 ([Anderson et al. 2011](#))
- DINEOF reconstruction at 5-day intervals

2009 Hindcast versus Cell Counts, Santa Barbara

Workflow for the C-HARM Forecasting Tool

Pseudo-nitzschia

Predicted "nowcasts" of harmful algal bloom (HAB) conditions are created through a combination of 1) sophisticated circulation models that predict the ocean physics, 2) satellite remote-sensing data of the ocean "color" and chlorophyll patterns, and 3) statistical models for predicting bloom and toxin likelihoods. These predictions are generated daily to provide a snapshot of where you might encounter a *Pseudo-nitzschia* bloom and/or domoic acid event.

INFORMATION TUTORIAL

We are soliciting the community to consult our product and provide feedback, particularly if HAB predictions have the potential to help in decision-making activities. The quick survey will help guide improvements and allow us to report to NASA what you, as important end-users, think about our product.

The map image displays the probability that the abundance of toxin-producing species of the diatom *Pseudo-nitzschia* in coastal waters is at or above the "bloom" threshold of 10,000 cells per liter. A value of 0.7, for example, means there's a 70% predicted probability of *Pseudo-nitzschia* blooms in that pixel.

Testimonials from Shellfish Growers and Marine Mammal Rescue Centers

"As with every model I use, such as weather and wind and swell, I watch them to see how it applies to my local conditions, and then I determine my own degree of accuracy and apply them to making decisions about how I manage the farm. When a DA event occurs for me, I will be combing the models to see how it relates to my situation."

– **Bernard Friedman, Santa Barbara Mariculture Company, Santa Barbara, CA**

"As the Medical Director of a southern California marine mammal rehabilitation center, I am always in need of current data concerning Domoic Acid blooms in southern California waters. We have been using these pictorial data to keep abreast of the seasonal trends in Domoic blooms that impact marine mammals in southern California waters. For the first time in 20 years we are able to verify Domoic Acid blooms in a timely fashion, that could result in moderate to severe pathologies and deaths in marine mammals in Orange County waters. **This is a classic example of 'fore-warned is fore-armed.'** We request that funding to this organization be continued to enable them to continue to produce such valuable data."

– **Dr. Richard Evans, The Pacific Marine Mammal Center, Laguna Beach, CA**

"There have been repeated calls for such capability at workshops and in publications from oceanographers, veterinarians, ecologists and public health officials, as these blooms have dramatic effects on marine mammal health as well as on the economy and human health."

– **Frances Gulland, Senior Scientist, The Marine Mammal Center, Sausalito, CA**

Testimonials from Fishermen and Boaters

"As dungeness crab fishermen, we are following these models daily."

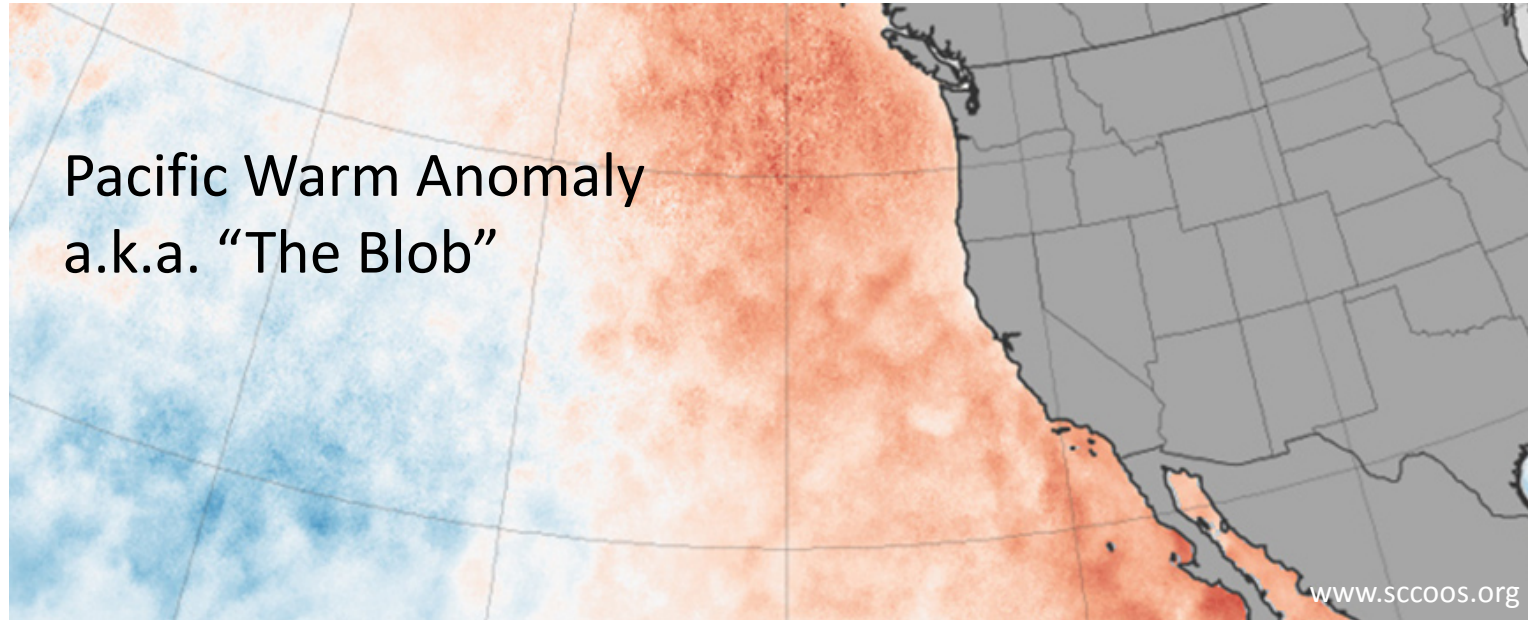

"As an off shore [*sic*] fisherman, this adds to the data I need to fish open water."

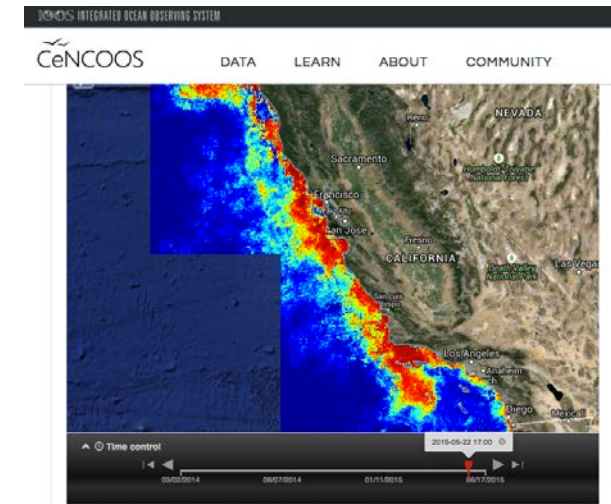

"I use these for kayaking and other outdoor recreation as well as to keep up with a generalized, and (when I am visiting here) specific understanding of what is going on from SF Bay, to the north and south. I started doing this because I live in east central IL, and kayak on rivers and Lake Michigan (itself an inland sea), and when I realized I could check the water quality, it made a big difference in when and where I go kayaking and/or deep water swimming." -**Aisha Sobh, concerned citizen**

2015 BLOOM of DOOM associated with “The Blob”

2017 – Extensive HAB in Southern California

Sea Lions Suffering From Domoic Acid Poisoning, Laguna Beach Rescue Says

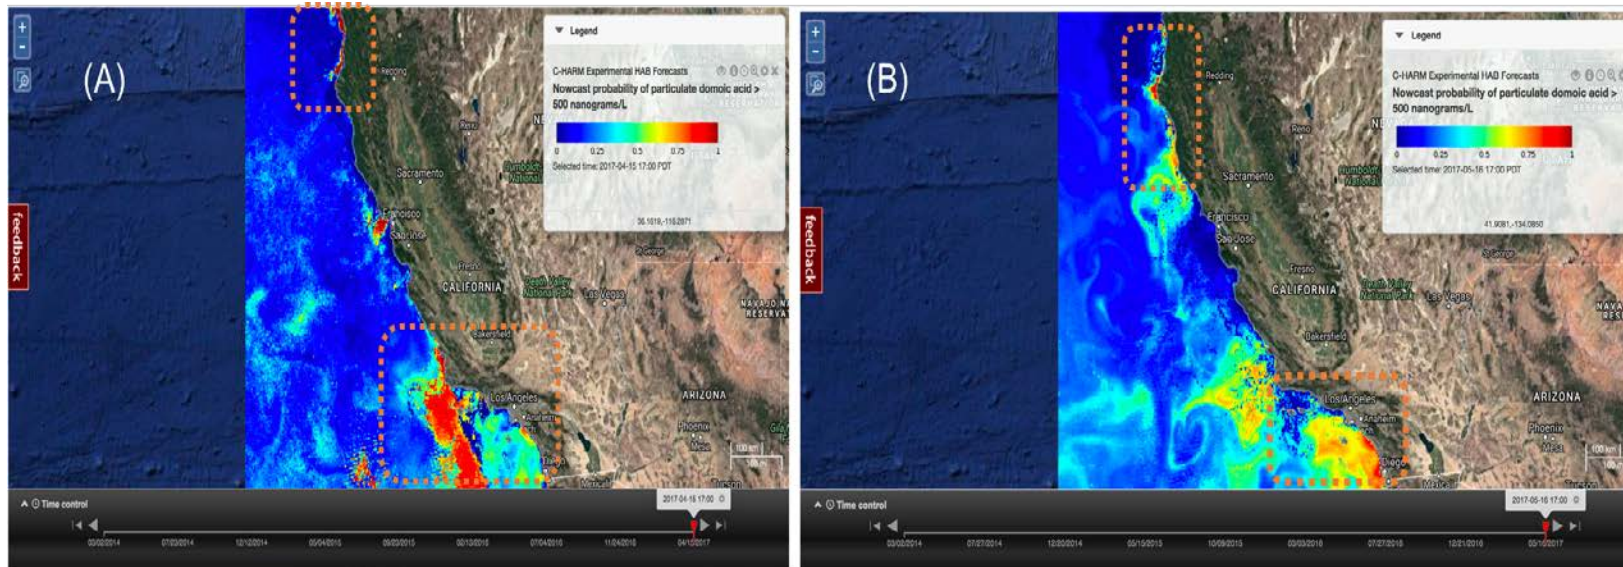

"In large concentrations, (the algae) produces neurotoxins that can destroy the brain," Pacific Marine Mammal Center said.

By Ashley Ludwig (Patch Staff) - April 11, 2017 12:23 pm ET | P

Like 181 | Share

Broad Impacts: **Animal Strandings/Death** [Sea Lions, Elephant Seals, Guadalupe Fur Seals, Seabirds (Common Murres, Grebes, CA Brown Pelicans)]; **Shellfish Advisories** in Santa Barbara and Ventura Counties

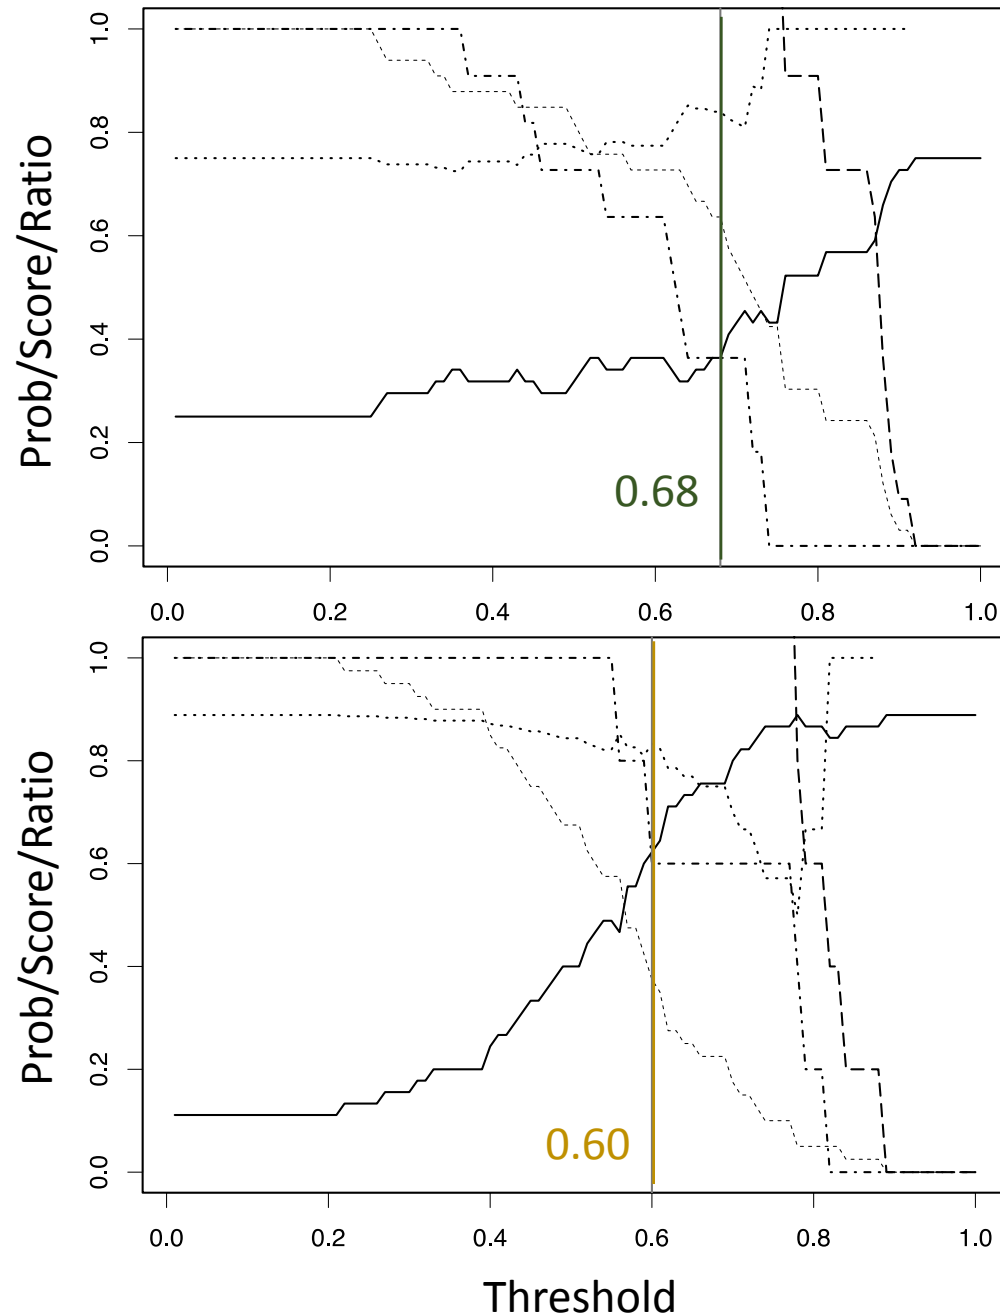

April 15 = HAB Onset

- Offshore Event
- Low toxins measured at piers
- Animals stranding in large numbers

May 17 = HAB moves South & North

- More Impacts felt near San Diego
- HAB persists in Santa Barbara Channel
- Rock Crab fishery closed in Nor Cal
