Introduction to Satellite Remote Sensing for Air Quality Applications

Webinar Session 4 – July 27, 2016

**NASA Trace Gas Products for Health/Air
Quality Applications**

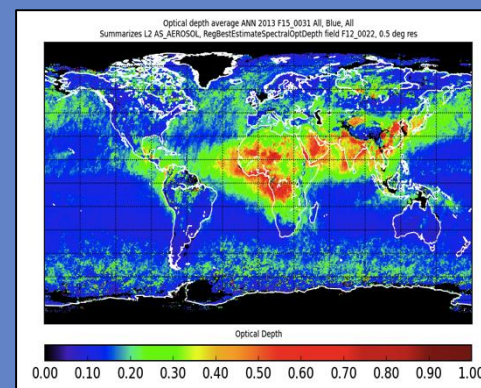

5 Weeks Webinar Series: Agenda

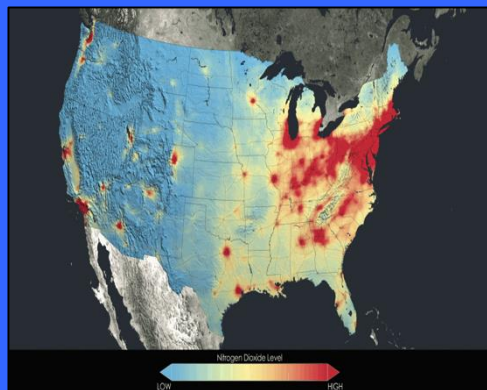

Week 1: Fundamental of Remote Sensing

Week 2: Satellite Imagery

Week 3: Aerosol Data

Week 4: Trace Gas Data

Week 5: Future Capabilities

Today's Instructor: **Bryan Duncan**
Code 614
NASA Goddard Space Flight Center
Greenbelt, MD 20771, USA
bryan.n.duncan@nasa.gov

National Aeronautics and Space Administration

“NASA & Health/Air Quality”

AQAST10 meeting at Research Triangle Park, North Carolina, January 5-7, 2016: click to access presentations.

AQAST is a NASA Applied Sciences Team of atmospheric scientists working in partnership with US air quality managers to exploit the power of Earth Science tools to address air quality issues. We conduct a wide range of projects using satellite data, suborbital data, and models, and work with air quality agencies at the local, state, regional, and national level. We are eager to hear from air quality managers about new issues where we may

Current and Planned Missions

- Formulation
- Implementation
- Primary Ops
- Extended Ops

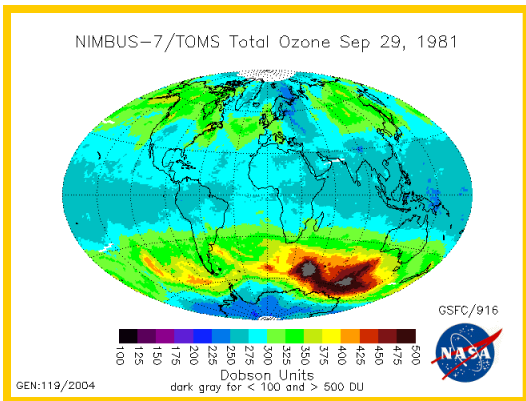

Satellites provide a "god's eye" view.

Primary Advantage = Spatial Coverage

Photo from NASA's
Skylab in 1973 of Los
Angeles smog

Spatial Coverage

If the orbit is too low and/or the FOV is too small, complete global coverage cannot be obtained with only 16 orbits in a single day

Nimbus-7 TOMS Orbital Altitude: 955 km

OMI Orbital Altitude: 705 km

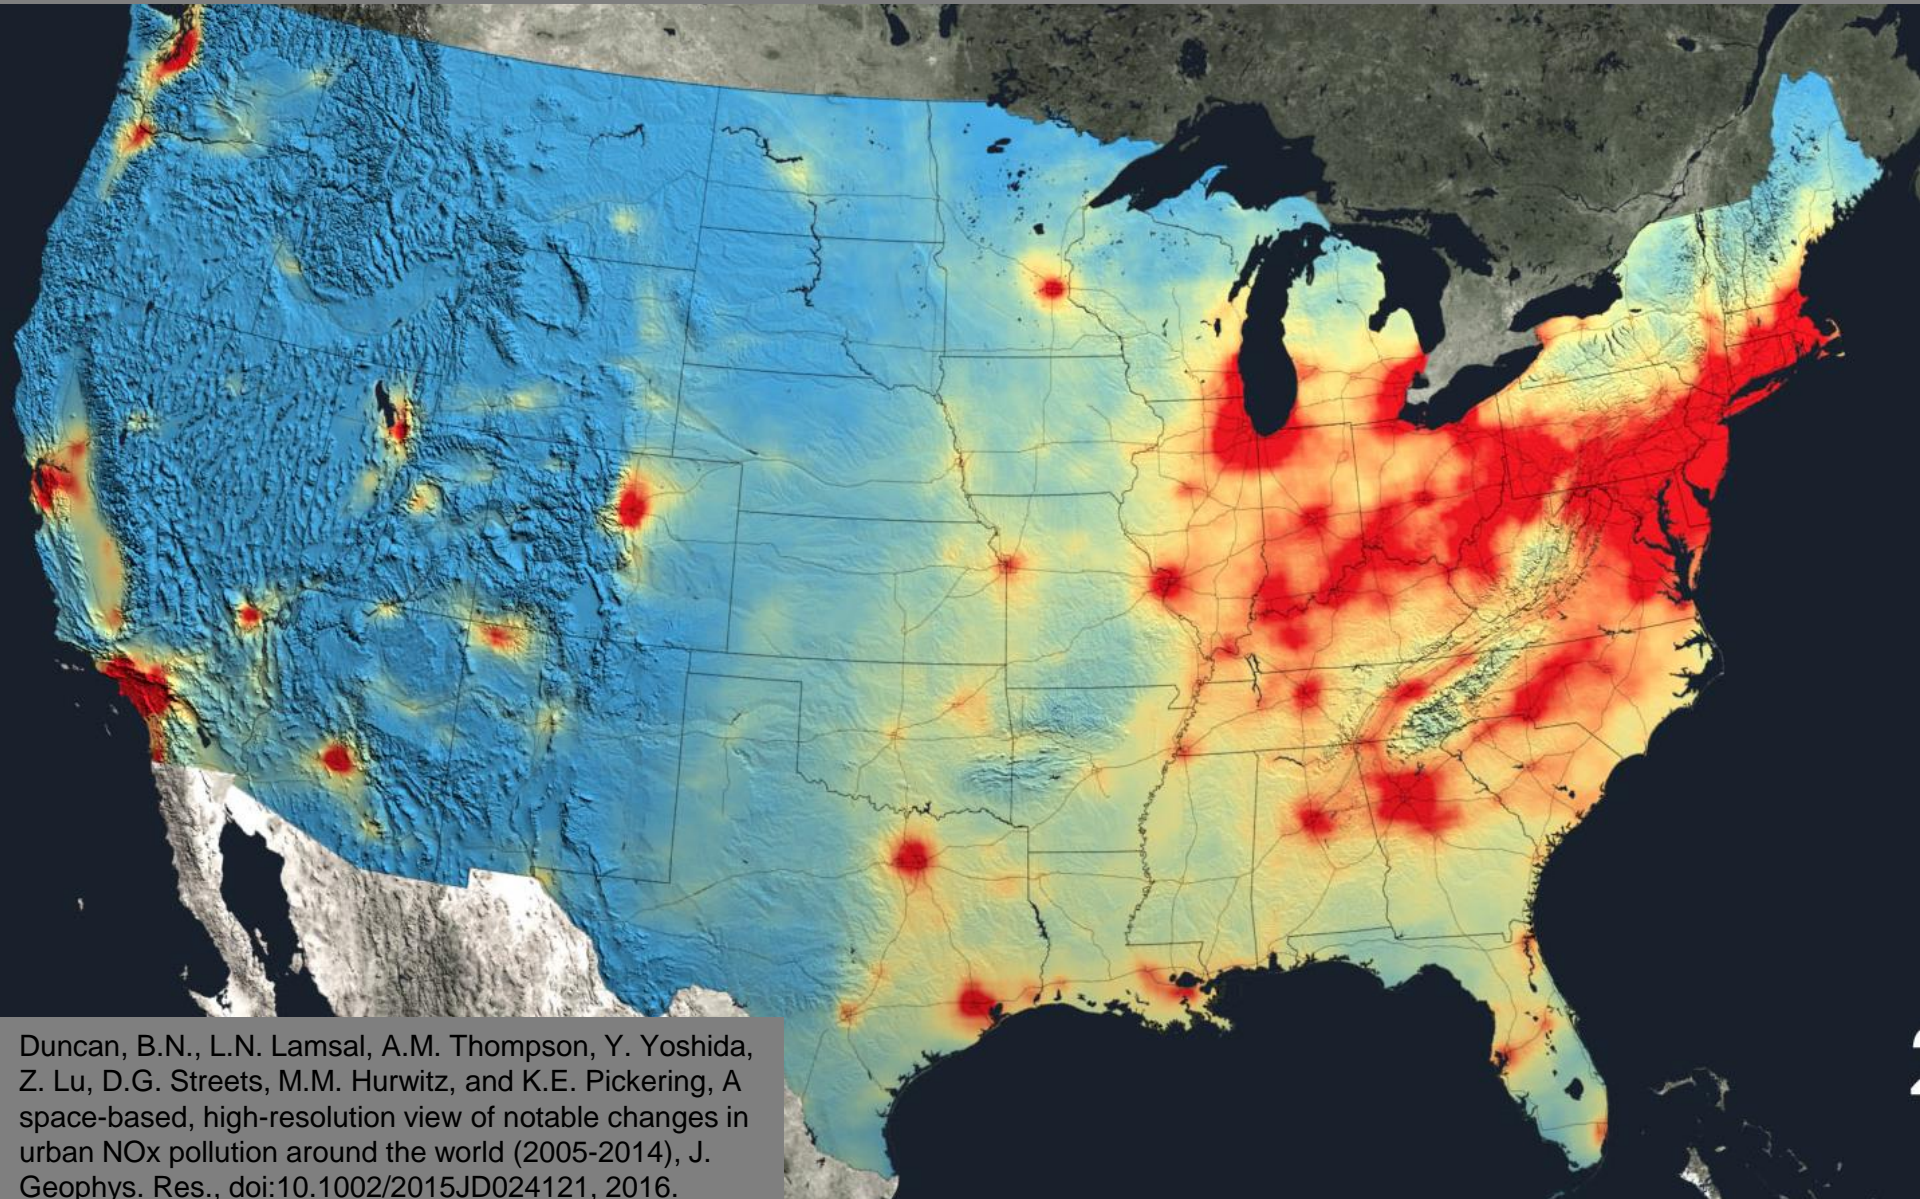

EarthProbe TOMS (original) Orbital Altitude: 500 km

Nitrogen Dioxide (NO₂)

NO₂ is produced when coal & gasoline are burned, so it comes out of tailpipes & smokestacks. It is unhealthy to breathe and is correlated with morbidity & mortality, likely since it is co-emitted with air toxics & is a necessary ingredient for ozone formation.

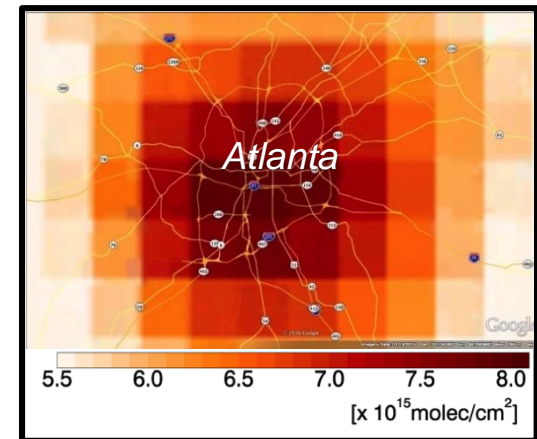

Duncan, B.N., L.N. Lamsal, A.M. Thompson, Y. Yoshida, Z. Lu, D.G. Streets, M.M. Hurwitz, and K.E. Pickering, A space-based, high-resolution view of notable changes in urban NO_x pollution around the world (2005-2014), *J. Geophys. Res.*, doi:10.1002/2015JD024121, 2016.

Nitrogen Dioxide (NO_2) Ozone Monitoring Instrument

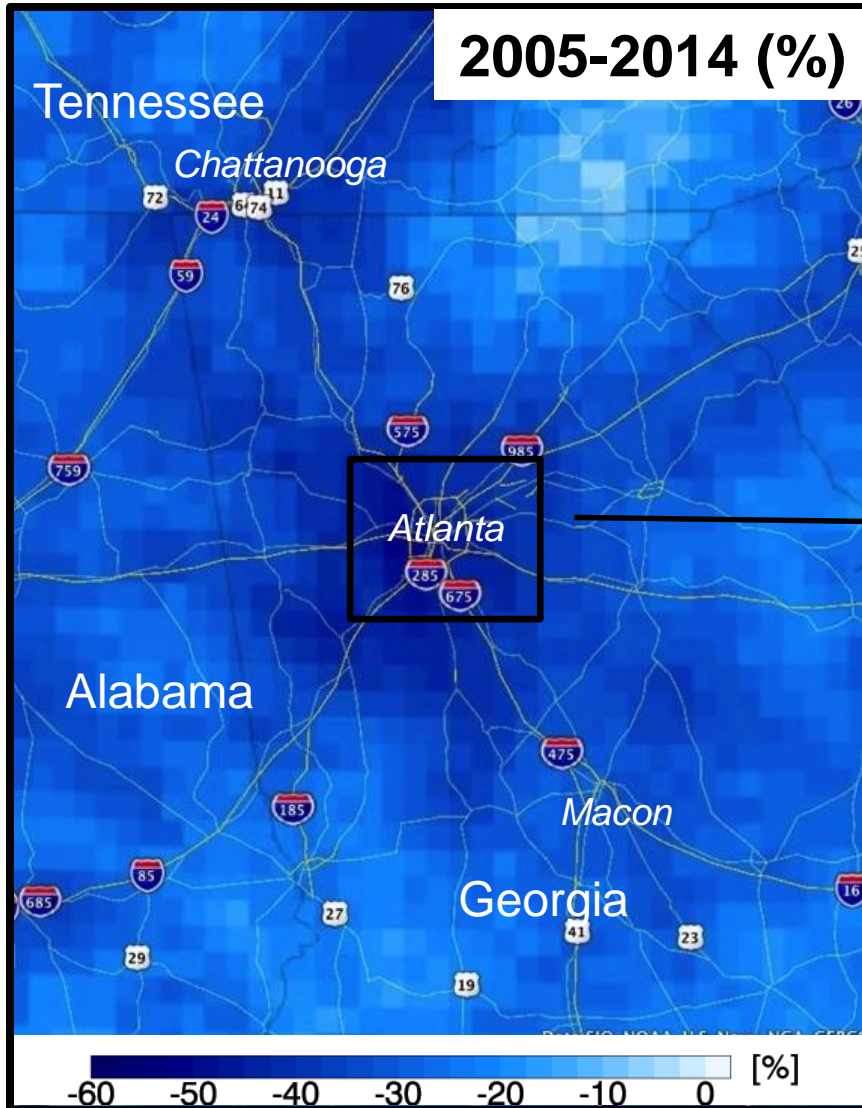

The satellite detects **sub-urban spatial gradients** in pollution within the Atlanta Metro area

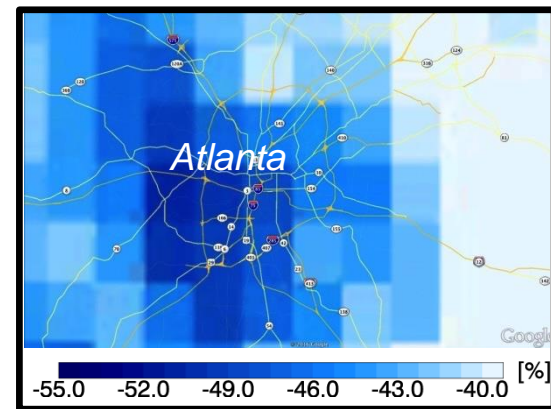

Pixel Resolution $\sim 10 \times 10$ km²

Nitrogen Dioxide (NO_2) Ozone Monitoring Instrument

Decrease from 2005 to 2014 (%)

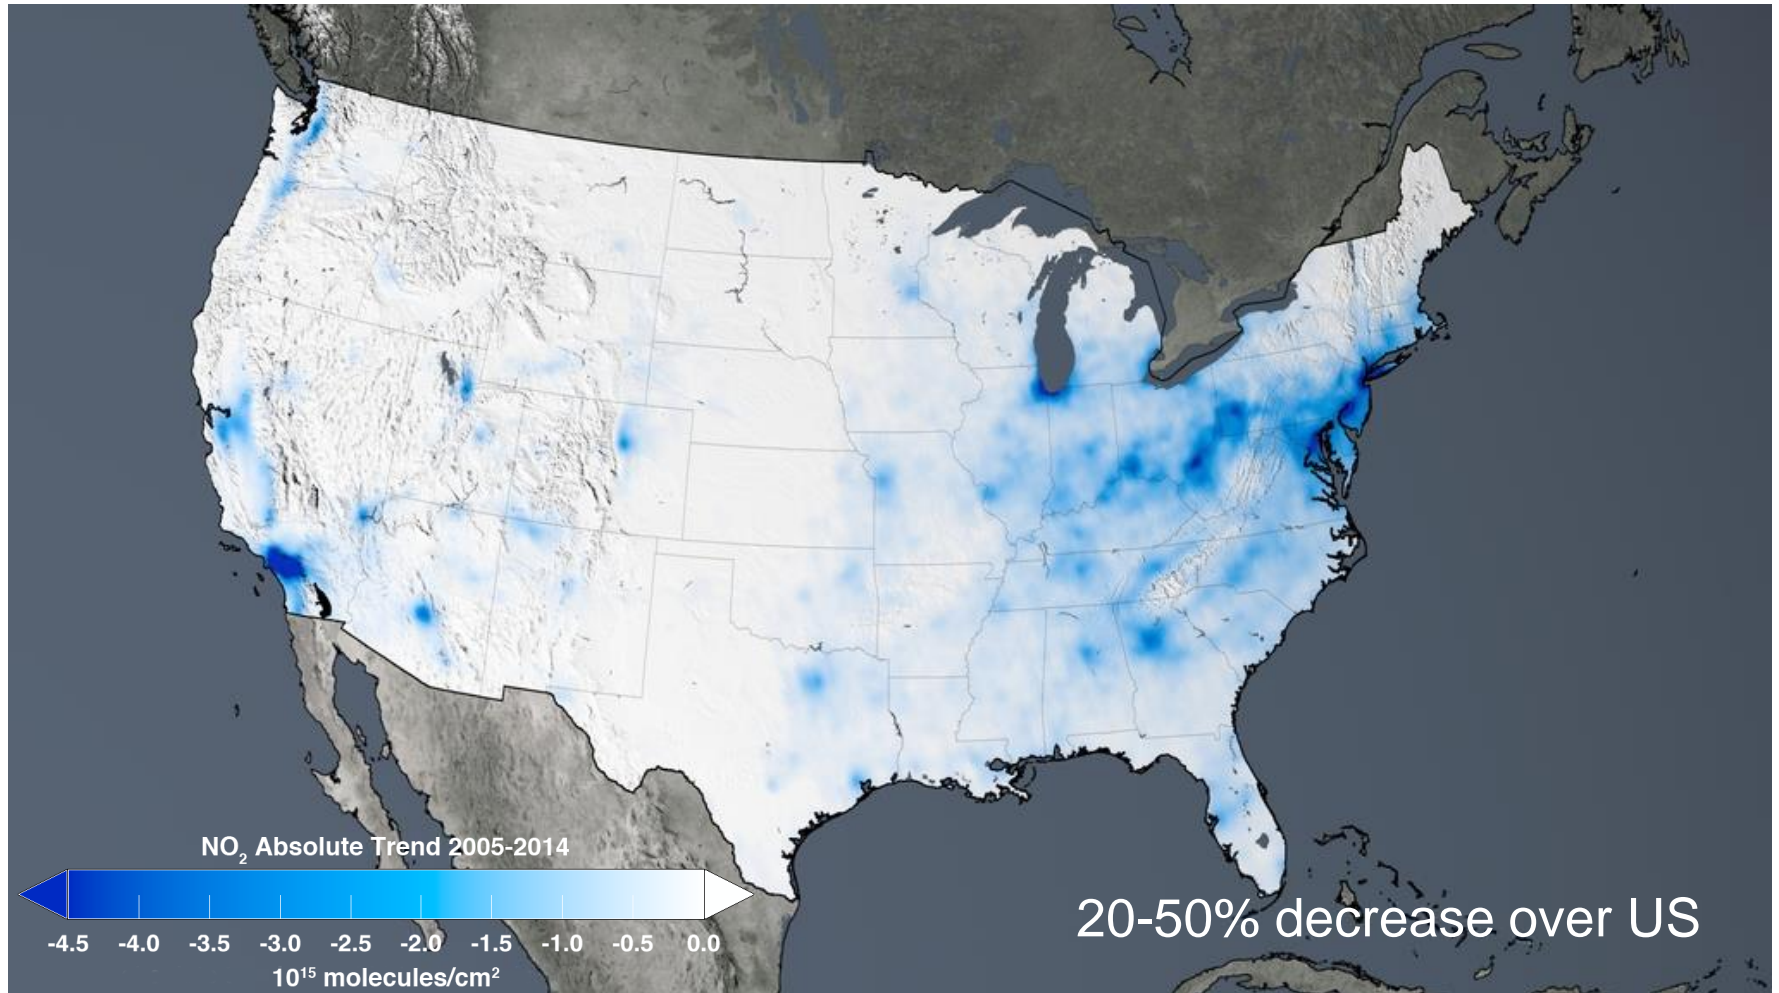

The satellite detects **sub-urban spatial gradients** in 1) pollution & 2) changes in pollution within the Atlanta Metro area.

Pixel Resolution $\sim 10 \times 10 \text{ km}^2$

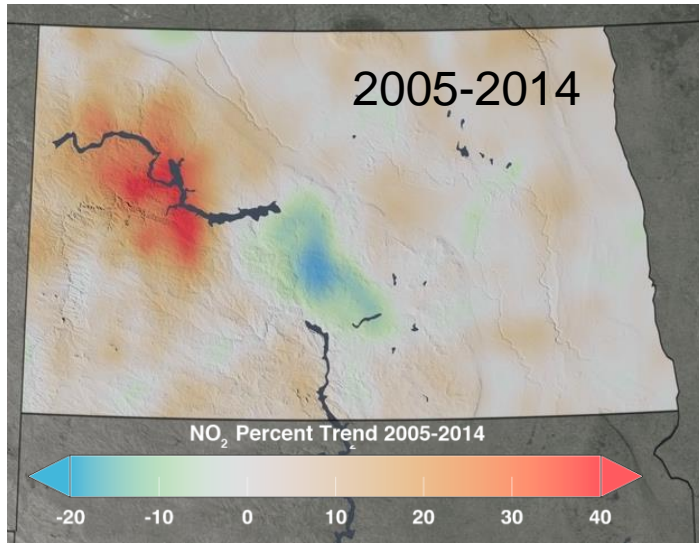

% Difference in OMI NO₂: 2005 - 2014

These NASA images are free and publicly available: <http://svs.gsfc.nasa.gov/12094>

The Clean Air Act is working!

OMI Detects NO₂ Increases from ONG Activities

How do Aura Ozone Monitoring Instrument (OMI) column data relate to quantities familiar to the AQ community?

“**Column**” = total # molecules between the satellite and the Earth’s surface (molecules/cm²)

Emissions

“Nose-level” concentrations

Quantification of gas abundances

Satellite Tracer	Typical Units
OMI O ₃ , SO ₂	Dobson Unit = 1 DU is 2.69 × 10 ¹⁶ ozone molecules/cm ²
OMI NO ₂ AIRS and MOPITT CO	Molecules/cm ² (i.e., Column)
TES CO, CH ₄ AIRS and MOPITT CO	Volume mixing ratio (e.g., ppbv)

National Ambient Air Quality Standards

Pollutant	Primary Standards		Secondary Standards	
	Level	Averaging Time	Level	Averaging Time
Carbon Monoxide	9 ppm (10 mg/m ³)			
	35 ppm (40 mg/m ³)			
Lead	0.15 µg/m ³ (2)			
	1.5 µg/m ³			
Nitrogen Dioxide	0.053 ppm (100 µg/m ³)			
Particulate Matter (PM ₁₀)	150 µg/m ³			
Particulate Matter (PM _{2.5})	15.0 µg/m ³			
	35 µg/m ³			
Ozone	0.075 ppm (2008 std)			
	0.08 ppm (1997 std)			
	0.12 ppm			
Sulfur Dioxide	0.03 ppm			
	0.14 ppm			

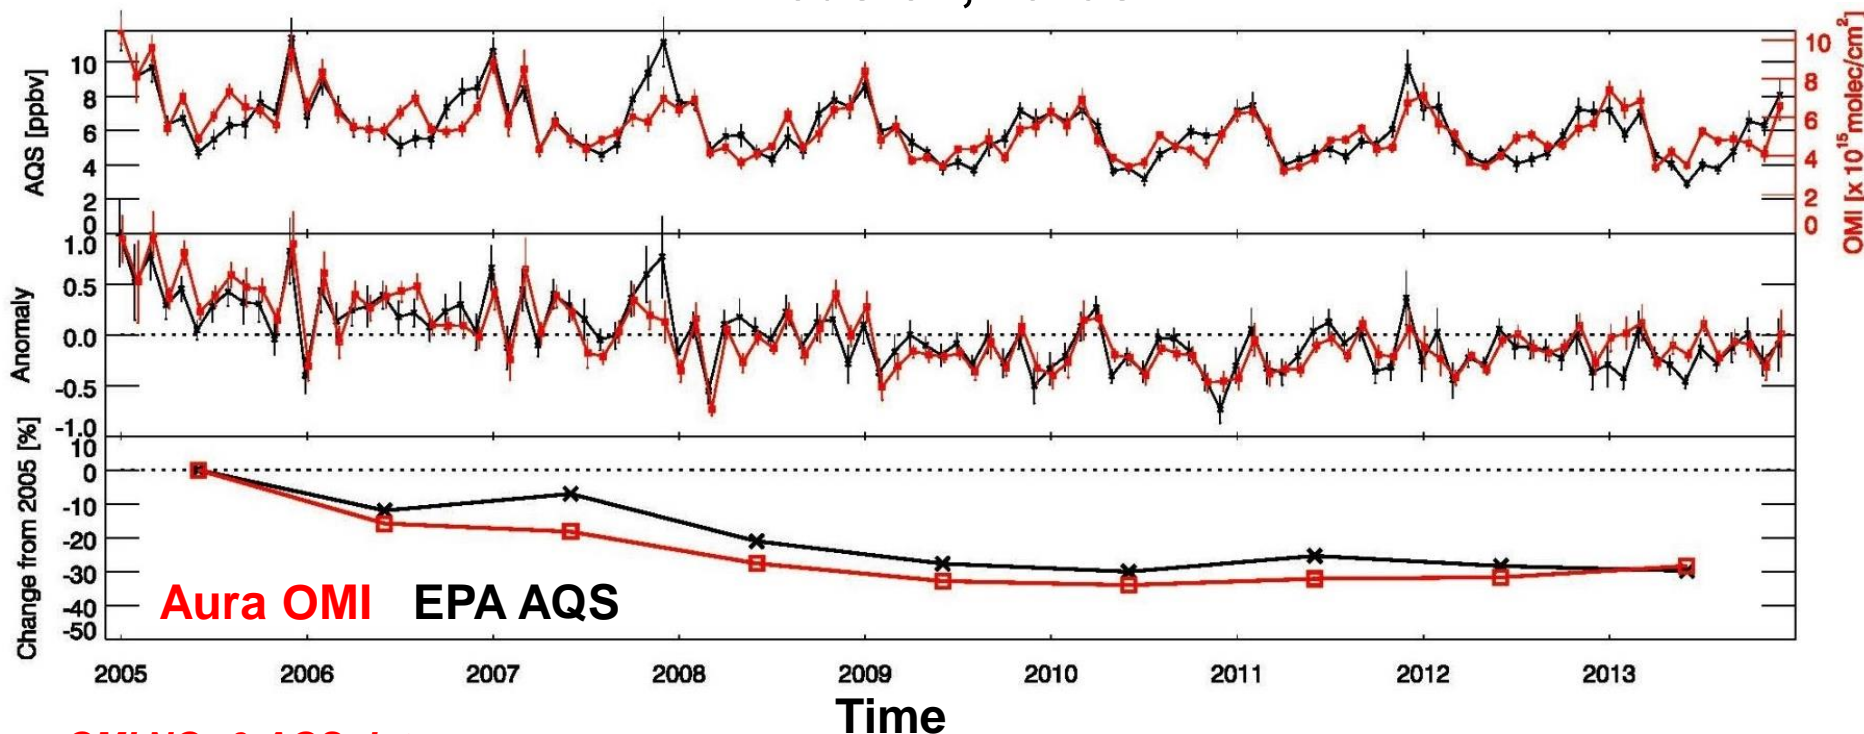

Note: None of the air quality standards for trace gases are in units typical of satellite measurements!

Remote Sensing applications for air quality has been done without consulting the needs of the air quality community.

A very hot topic of research is now is “How do we relate column measurements to ground level values and exposure?”

How do the OMI NO₂ data compare to EPA's surface levels?

Houston, Texas

OMI NO₂ & AQS data

Lamsal, L.N., B.N. Duncan, Y. Yoshida, N.A. Krotkov, K.E. Pickering, D.G. Streets, and Z. Lu, "U.S. NO₂ variations and trends (2005-2013) estimated from an improved Ozone Monitoring Instrument (OMI) tropospheric column data product mirror those estimated from AQS surface observations", doi: 10.1016/j.atmosenv.2015.03.055, Atmos. Environ., 2015.

AIR QUALITY FROM SPACE

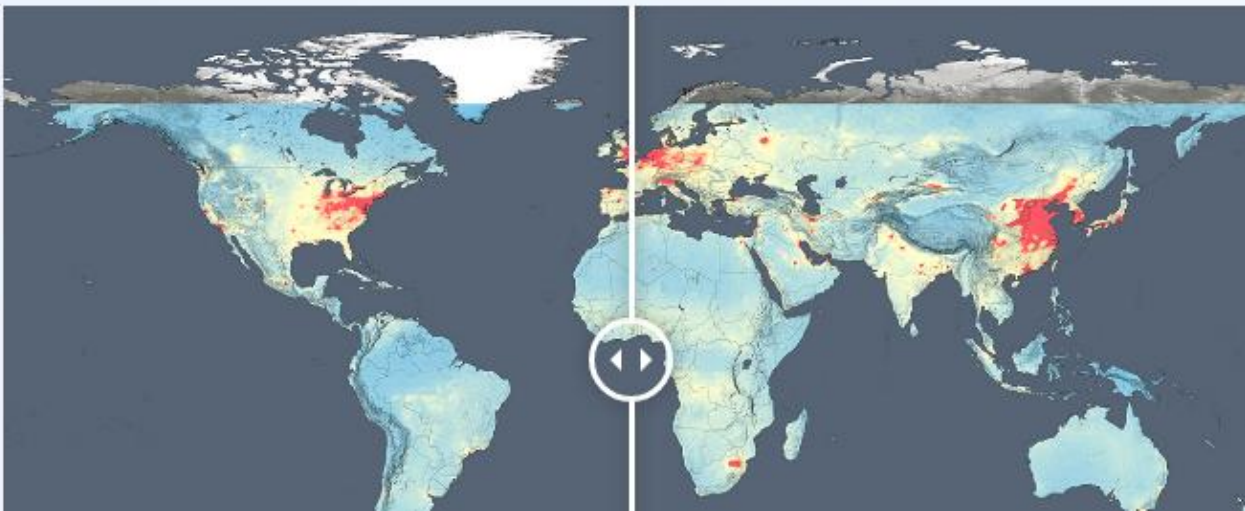

Only NO₂ for now, but plan to add others!

Welcome to the website! Currently, the website is devoted to one air pollutant, nitrogen dioxide (NO₂), which is unhealthy to breathe and a necessary ingredient for the formation of unhealthy levels of surface ozone, another important pollutant. Our intended audience is health and air quality managers, but there is a lot of content that will be of interest to many people, including plots of data for almost 200 world cities!

[CLICK HERE TO SEE PRESIDENT OBAMA DISCUSS OMI NO₂ DATA!!!](#)

What is the air quality like in your city and country? Just click on the "Data" tab above and then "World Regions" to see.

Before and After: World Nitrogen Dioxide Levels, 2005-2014

Air Quality Data on the Top 20 US Cities

A satellite-style map of the United States is shown, with a semi-transparent grey rectangular box overlaid in the center. The map displays various geographical features, including the West Coast, the Great Plains, and the Eastern seaboard. The text is centered within the box.

U.S. Trace Gas Data
(NO₂ isn't the only game in town!)

Passive Remote Sensing Techniques

- There are several passive remote sensing techniques based on the viewing geometry of the instrument:

1. Backscatter ultraviolet (BUV) – i.e. OMI instrument

- The BUV technique looks directly down at the atmosphere (nadir viewing) to measure the amount of shortwave solar radiation scattered back up to the satellite. Through this, OMI is able to measure total column amounts of NO₂, HCHO, Ozone, and SO₂

2. Limb emission (or limb viewing) - TES, AIRS, MOPITT instruments

- This technique measures the longwave radiation (infrared or microwave) thermally emitted in the atmosphere along the line of sight of the instrument, from which they infer vertical profiles of trace gases.

Aura Satellite

- Orbit: Polar: 705 km, sun-synchronous, 98° inclination, ascending 1:45 PM equator crossing time
- Launched July 15, 2004

OMI measures UV & visible wavelengths of light backscattered from the Earth & atmosphere: NO₂, SO₂ and HCHO

NASA/NOAA Satellites

Aura (2004 launch)

OMI (columns) = NO₂, SO₂, H₂CO, O₃*

TES (vertical profiles) = O₃, CO, CH₄, HDO, PAN, NH₃, CO₂

Terra (1999)

MOPITT (columns) = CO

Aqua (2002)

AIRS (layers) = NH₃

Suomi NPP (2011)

OMPS (columns) = SO₂, H₂CO

OCO-2 (2014)

CO₂ (columns) – data under development

*Determining surface O₃ is not currently possible.

OMI

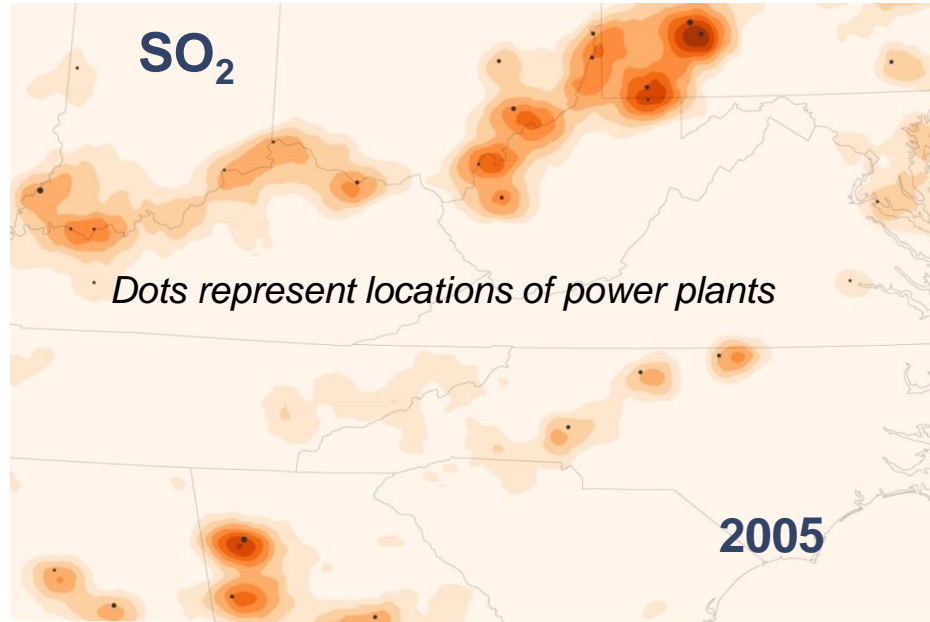

Ozone Monitoring Instrument

- Dutch/Finnish Instrument
- Launched July 15, 2004
- Nadir solar backscatter spectrometer
- Spectral range UV/Visible 270-500 nm (resolution~0.5nm)
- Spatial resolution: 13X24 km footprint at nadir
- Swath width: 2600 km (global daily coverage)
- Local Overpass time = 13:45 (+/- 15 min)

OMI Sulfur Dioxide

*Can track volcanic
SO₂ as well*

*Data from the Dutch/Finnish
Ozone Monitoring Instrument
on NASA's Aura Satellite*

OMI Sulfur Dioxide

Ohio River Valley

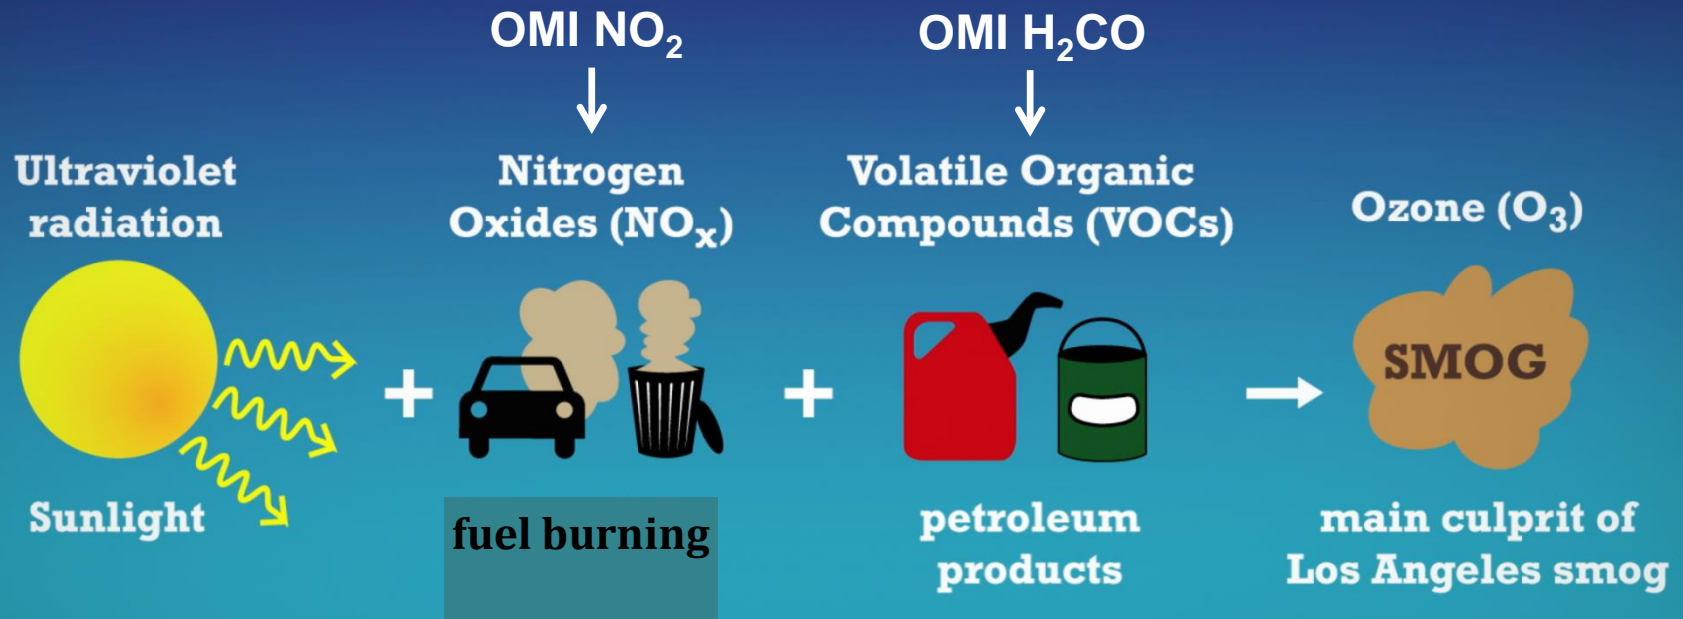

China

To put US air quality into a global perspective!

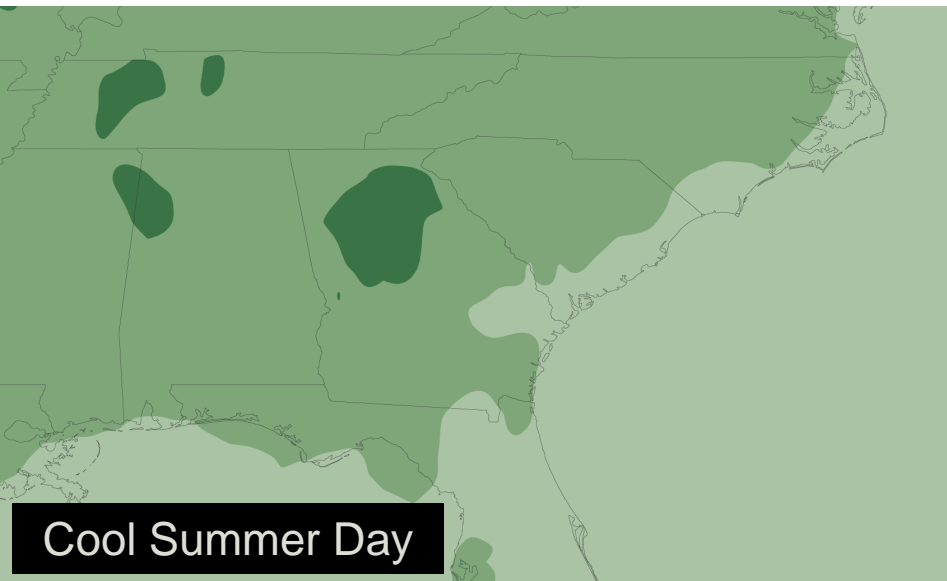

We can't infer “nose-level” ozone yet, but we do have information on ozone precursors: **NO_x** & **VOCs**

H₂CO is an oxidation product of most VOCs, so it is a good proxy for “VOC reactivity”.
NO₂ is a reasonable proxy for NO_x = NO + NO₂.

So we have information on the sensitivity of ozone's formation to NO_x and VOCs.

OMI Formaldehyde (HCHO)

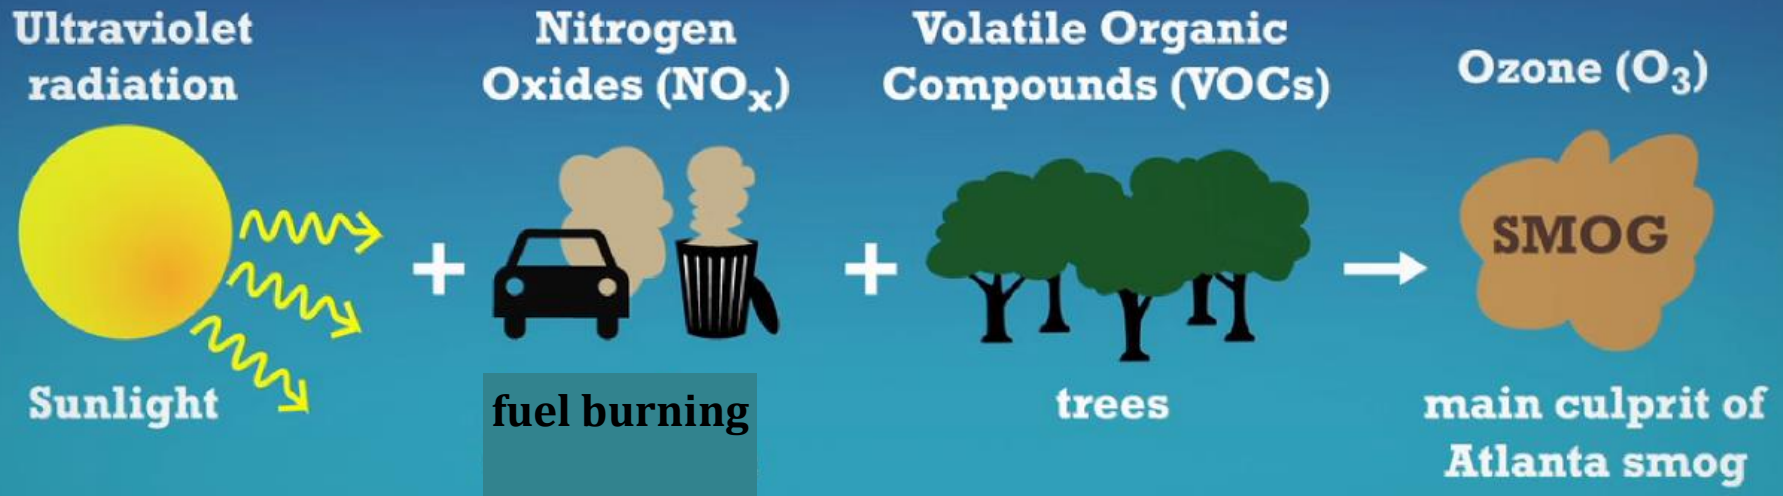

Low

High

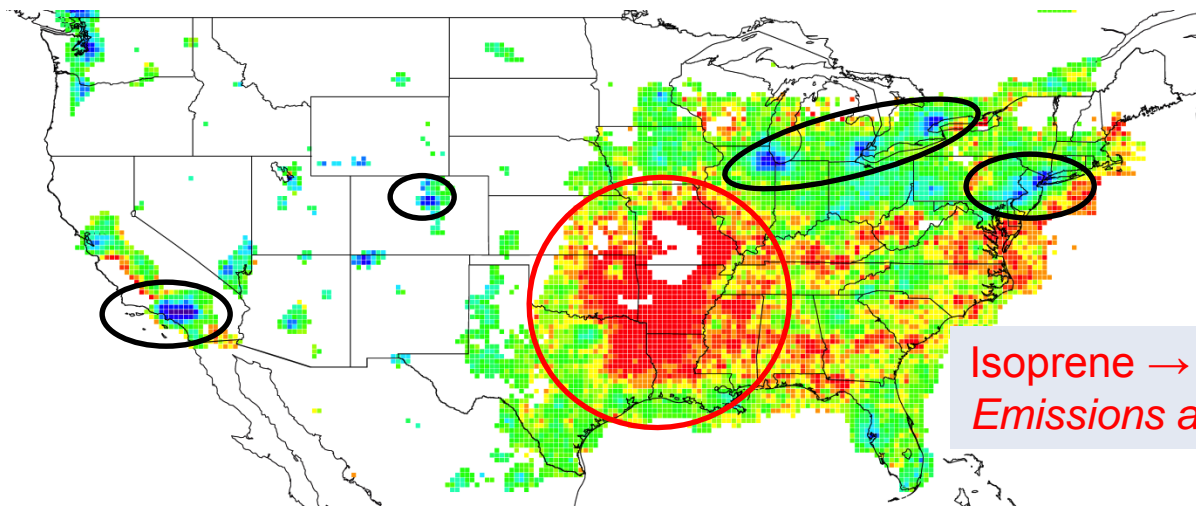

HCHO is a proxy for the emissions of isoprene, a natural VOC that often dominates ozone formation chemistry.

Reducing VOCs from Cars/Factories is Ineffective

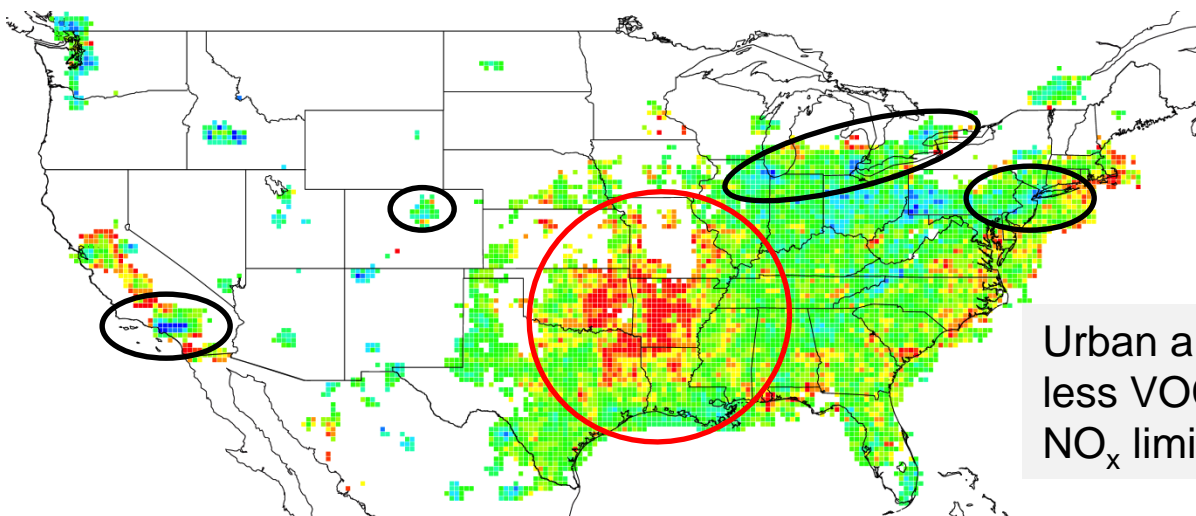

OMI HCHO/NO₂: A Proxy for Ozone Formation Sensitivity

2005

Isoprene → HCHO
Emissions are T-dependent

2013

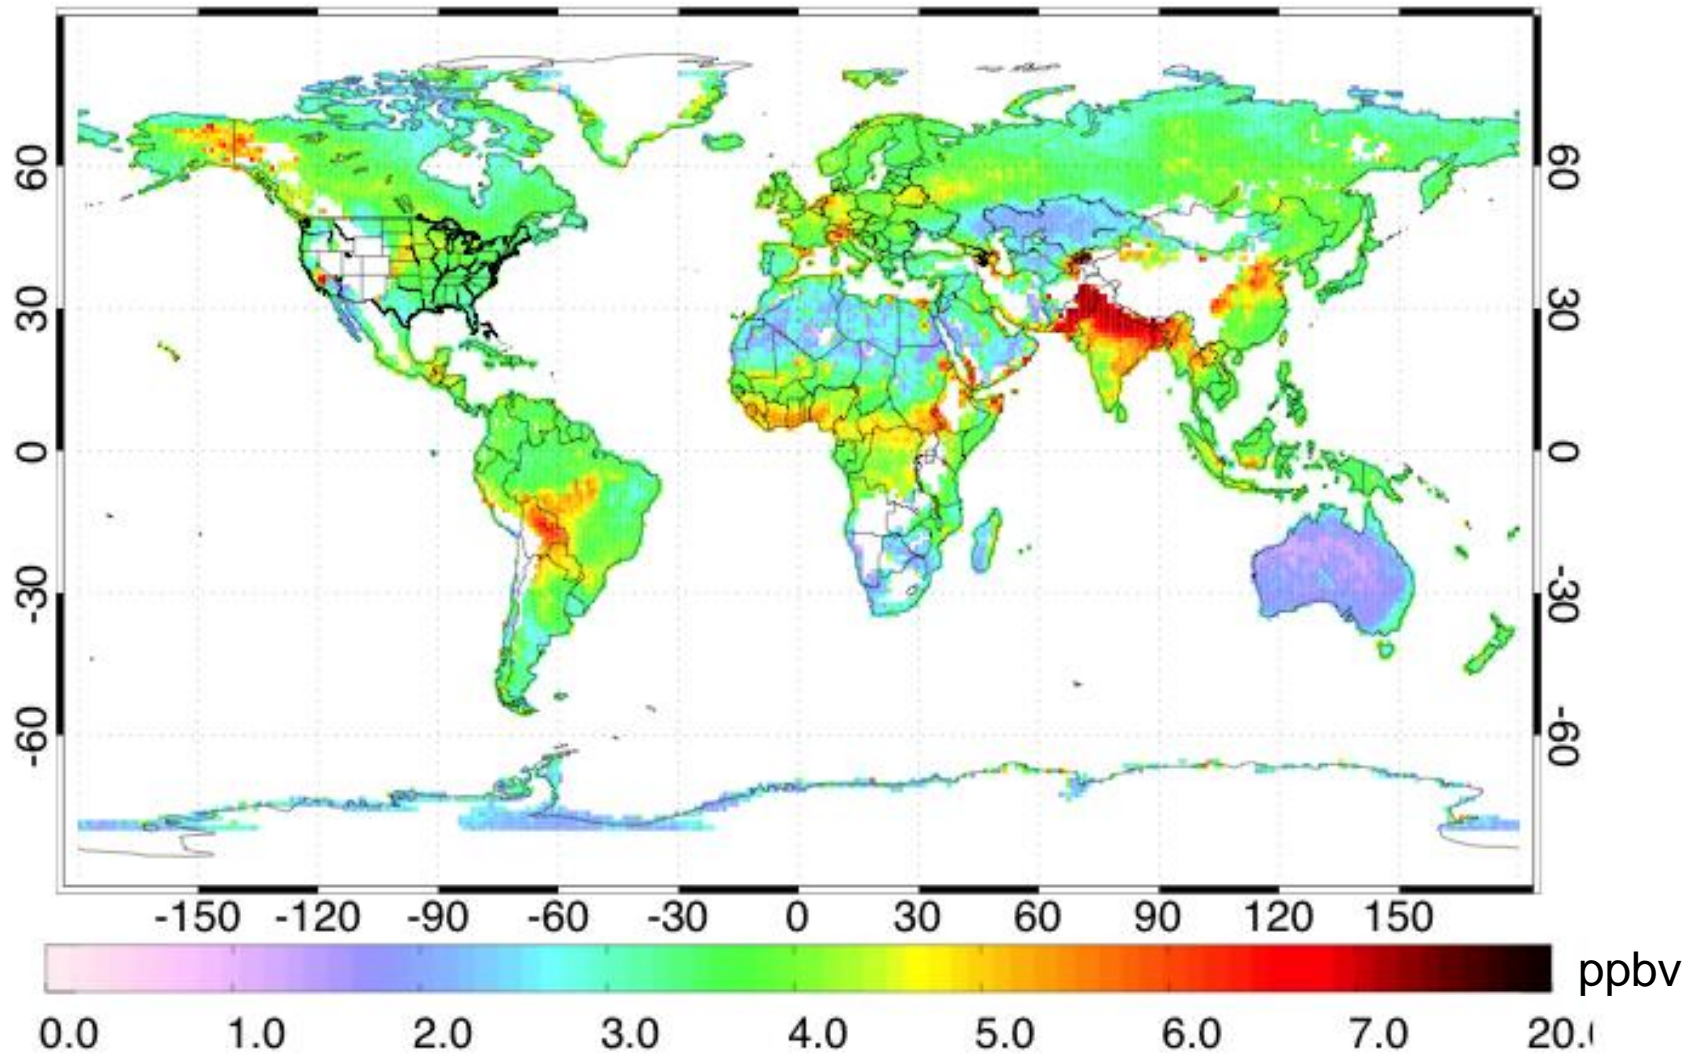

Urban areas becoming
less VOC-limited : more
NO_x limited.

Duncan et al., *Application of OMI observations to a space-based indicator of NO_x and VOC controls on surface ozone formation*, Atmos. Environ., 44, 2213-2223, doi:10.1016/j.atmosenv.2010.03.010, 2010.

AIRS Ammonia (NH₃) Data Product (2002 - 2014)

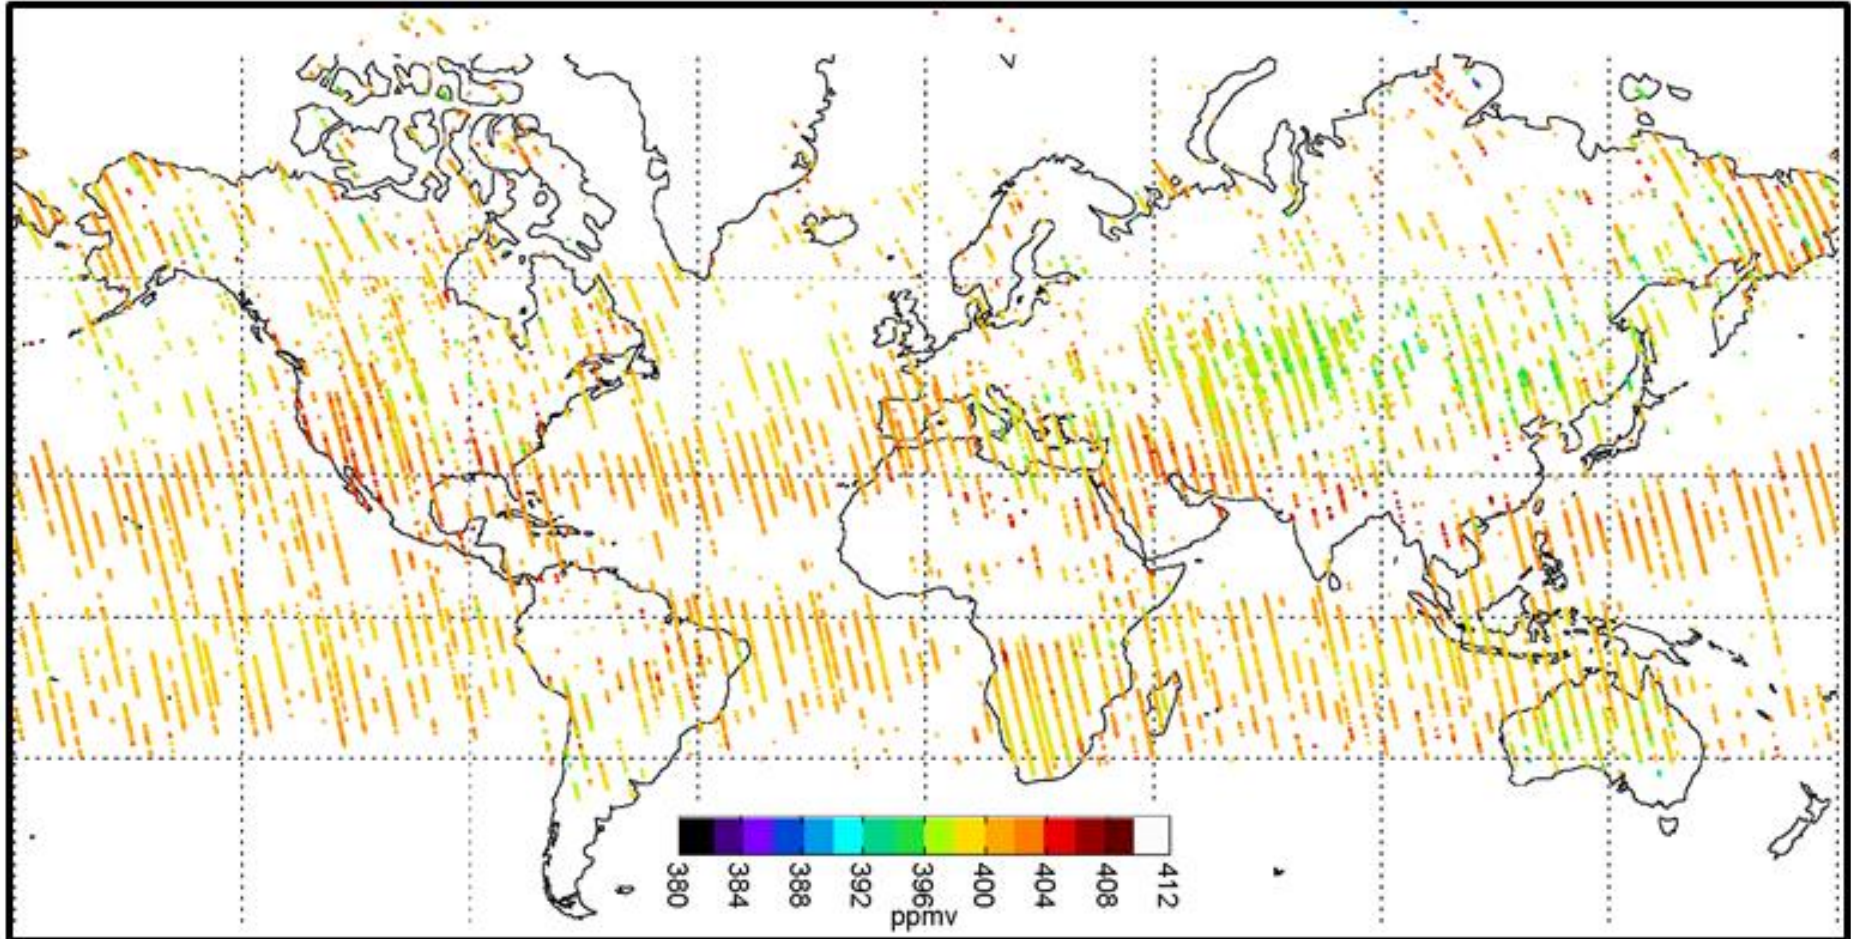

Average Ammonia (ppbv; 2002-2014) @ 918 mb

Warner et al., *The global tropospheric ammonia distribution as seen in the 13-year AIRS measurement record*, *Atmos. Chem. Phys.*, 16, 5467–5479, doi:10.5194/acp-16-5467-2016, 2016.

TES**Tropospheric
Emission Spectrometer**

Emerging TES AQ products:

What	Where	Why
Formic Acid	Surface to 700 hPa	Ozone production, aerosol precursor and biogenic tracer
Methanol	Surface to 700 hPa	Ozone production, aerosol precursor and biogenic tracer
CO Profiles using MLS and TES	Surface to 10 hPa	Biomass burning and Convection
Ozone profiles using TES and OMI Radiances	Surface to 10 hPa	Improved Lower Troposphere and Upper Troposphere ozone estimates during all seasons

Tropospheric Emission Spectrometer (TES) megacity measurements help quantify urban pollution production, transformation & export

Since Jan 2013, TES has used its unique targeting capabilities to measure a suite of pollutants in 19 of the world's megacities, including Mexico City

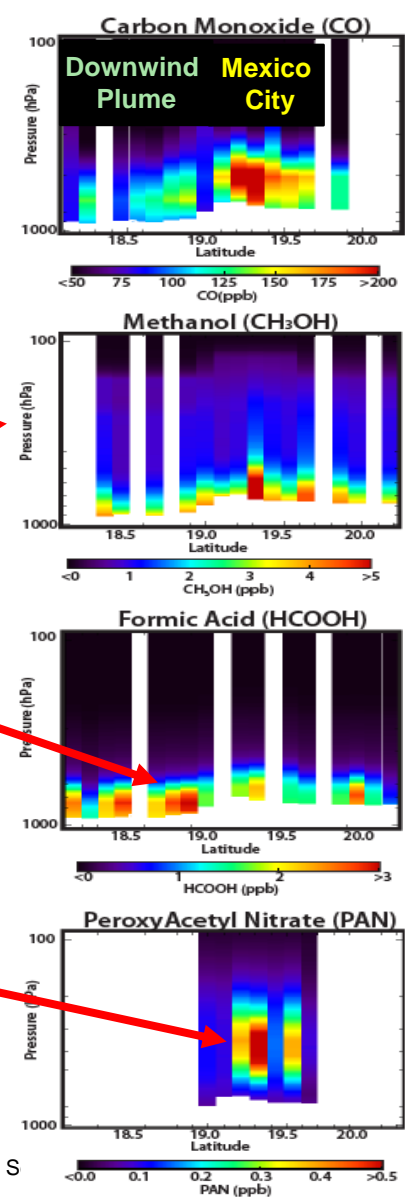

Megacity Pollution: The jointly retrieved TES/OMI near-surface ozone product shows very high ozone (~120 ppb) in Mexico City on a day with stable, stagnant air in the boundary layer.

TES carbon monoxide, methanol, & formic acid (ozone precursors) are also elevated, as is the nitrogen reservoir peroxyacetyl nitrate (PAN)

Chemical Transformation: Downwind, TES data show that most trace gases are diluted in the plume, but formic acid concentrations are higher than in the city, which may indicate secondary production from organic aerosol

Export Potential: PAN drives ozone production far from source regions, so the large PAN concentrations suggest that Mexico City pollution has larger-scale impacts

Aura Tropospheric Emission Spectrometer (TES) megacity measurements identify large biomass burning contribution to urban pollution

The suite of TES observations allows quantification of the impact of seasonal biomass burning pollution on the already poor air quality of the world's megacities.

Mexico City: April-May Biomass burning on the Yucatan Peninsula

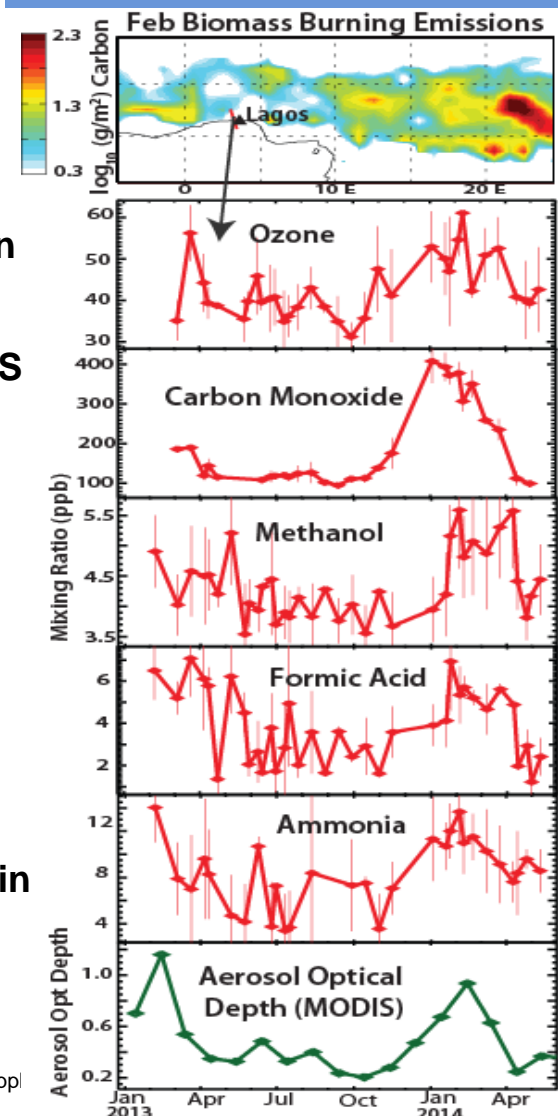

TES megacity measurements show peak ozone levels during biomass burning season in Mexico City, Mexico and Lagos, Nigeria.

Concomitant biomass burning products (TES carbon monoxide, methanol, formic acid, ammonia) and smoke (from MODIS aerosol optical depth) suggest that nearby fires contribute significantly to urban ozone.

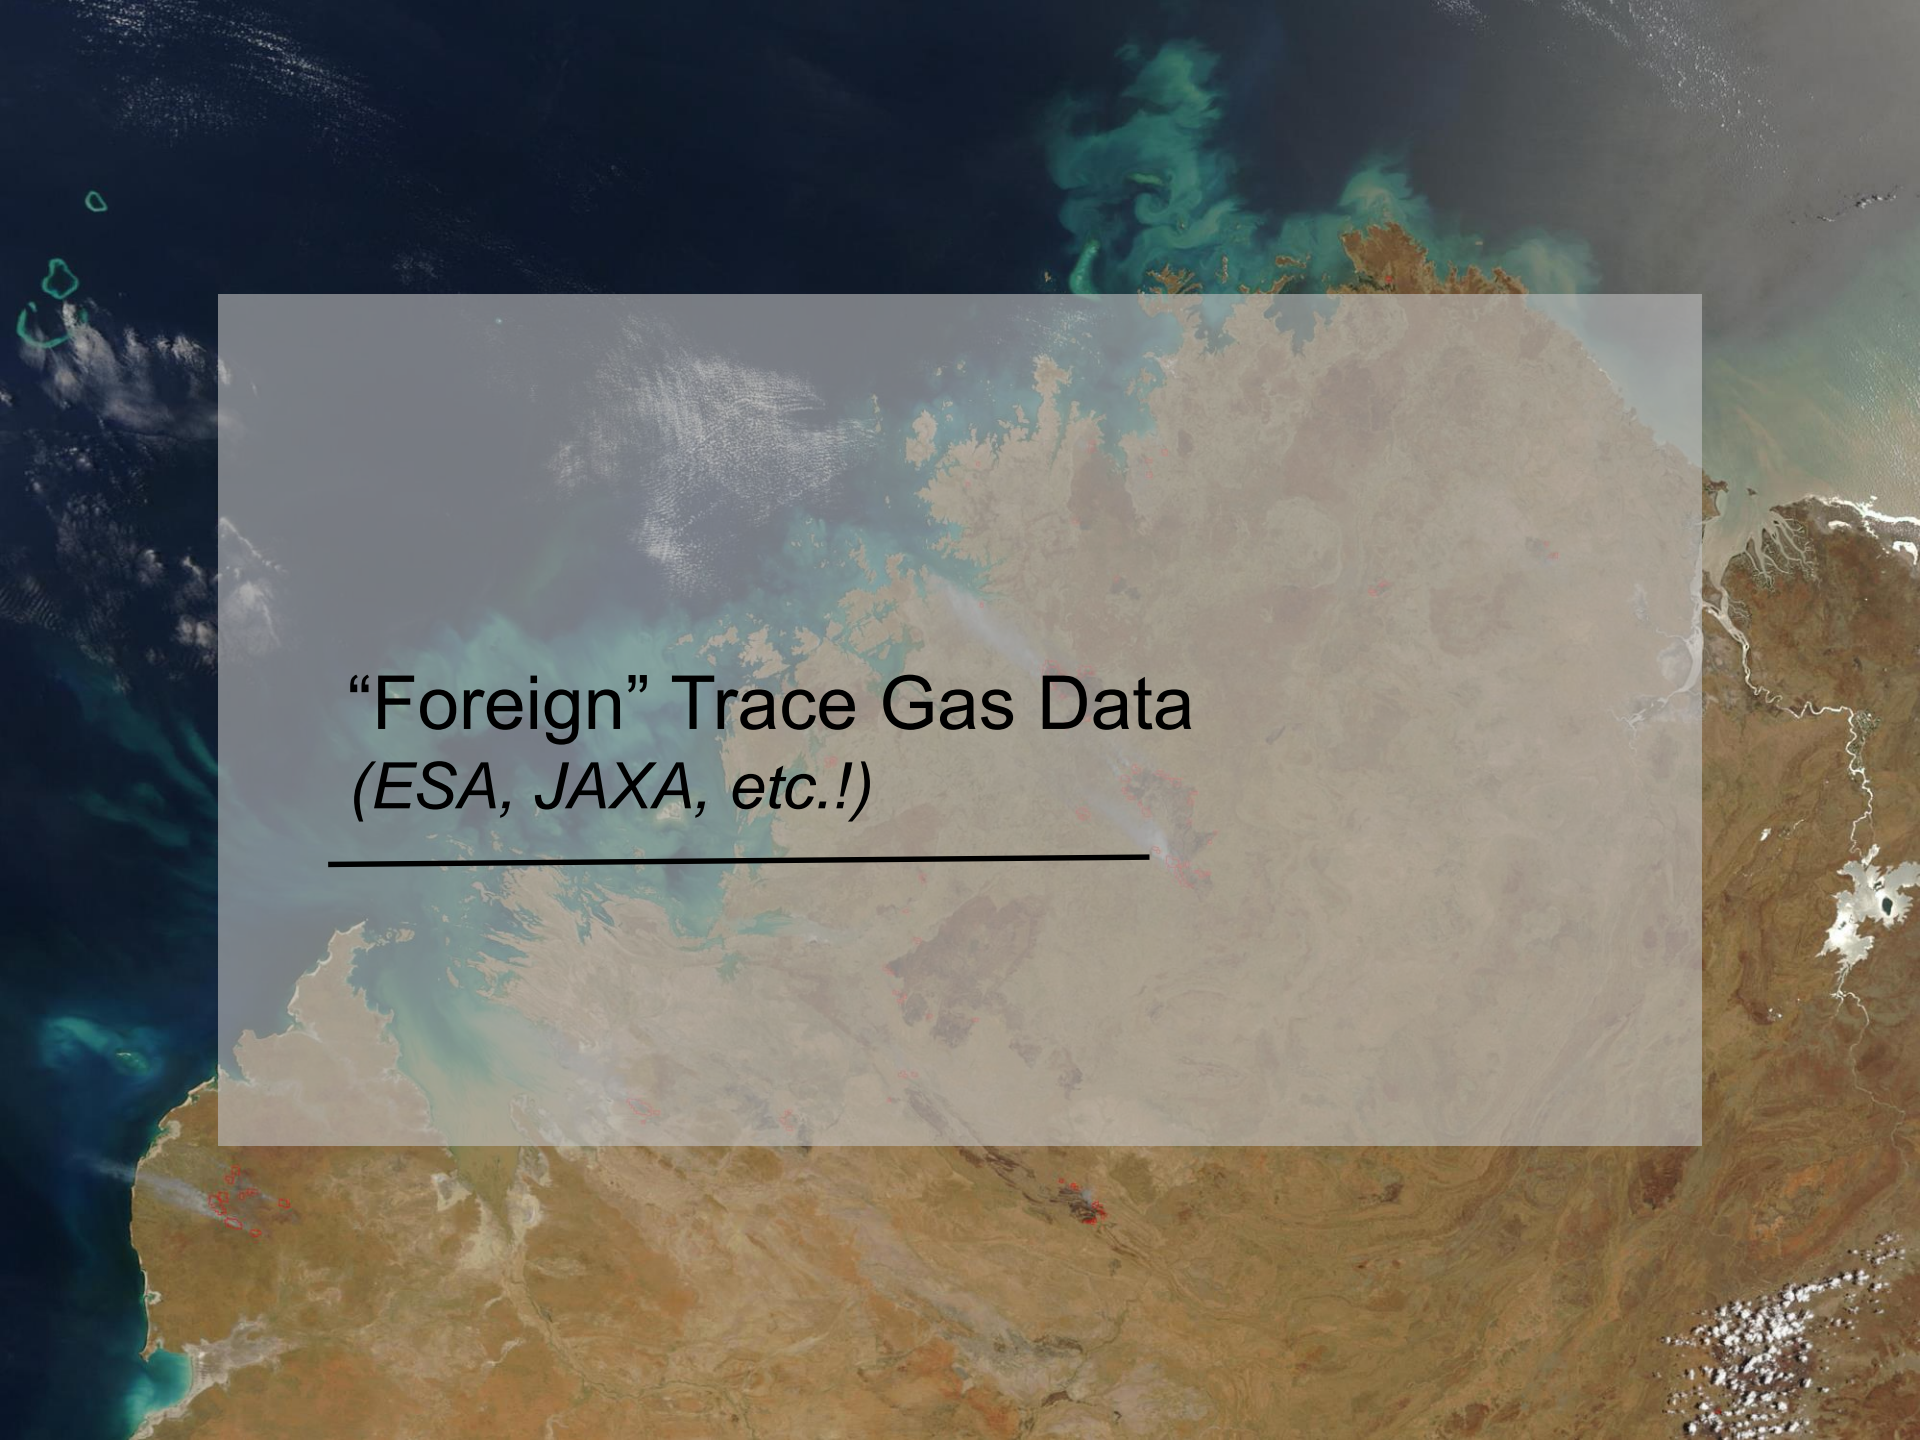

Lagos carbon monoxide, formic acid, and ammonia have higher peak values than Mexico City, but ozone is lower. These differences in chemical regime are being investigated.

Methanol and formic acid are more variable in Lagos than Mexico City, likely due to large sources of volatile organic compounds associated with oil and gas extraction in the region (Marais et al., 2014).

Lagos: December-March Biomass burning in Central Africa

Appl

A solid black horizontal line is positioned below the text. The background map shows various shades of blue, green, and brown, with some red and white markers scattered across the landmasses.

Future Trace Gas Data

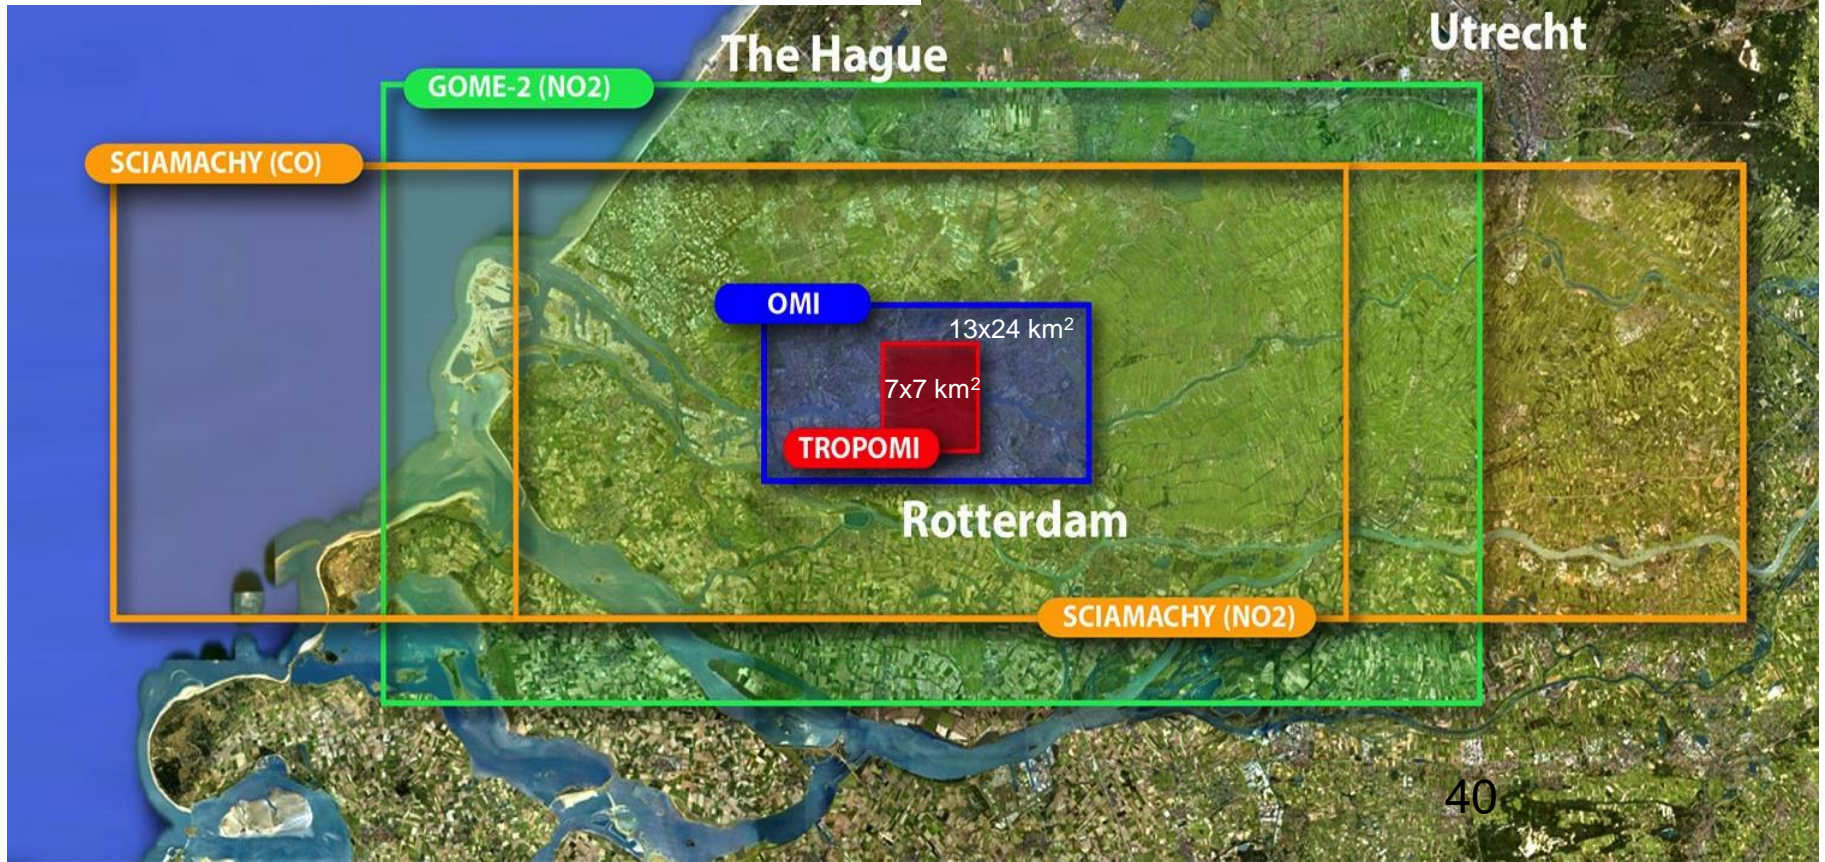

(In the works!)

TROPOMI Highlights

- **Launch 2016**
- Observes whole globe
- Sub-urban spatial resolution (7 km x 7 km)
- 1x/day: NO₂, ozone (0-2 km vertical), aerosol, clouds, formaldehyde, glyoxal, SO₂, CO, methane

Measuring on Sub-Urban Level

European Space Agency TROPOMI

Improving Spatial Resolution!

OMI (now)

TROPOMI (launch 2016)

Upcoming Instruments

NASA TEMPO

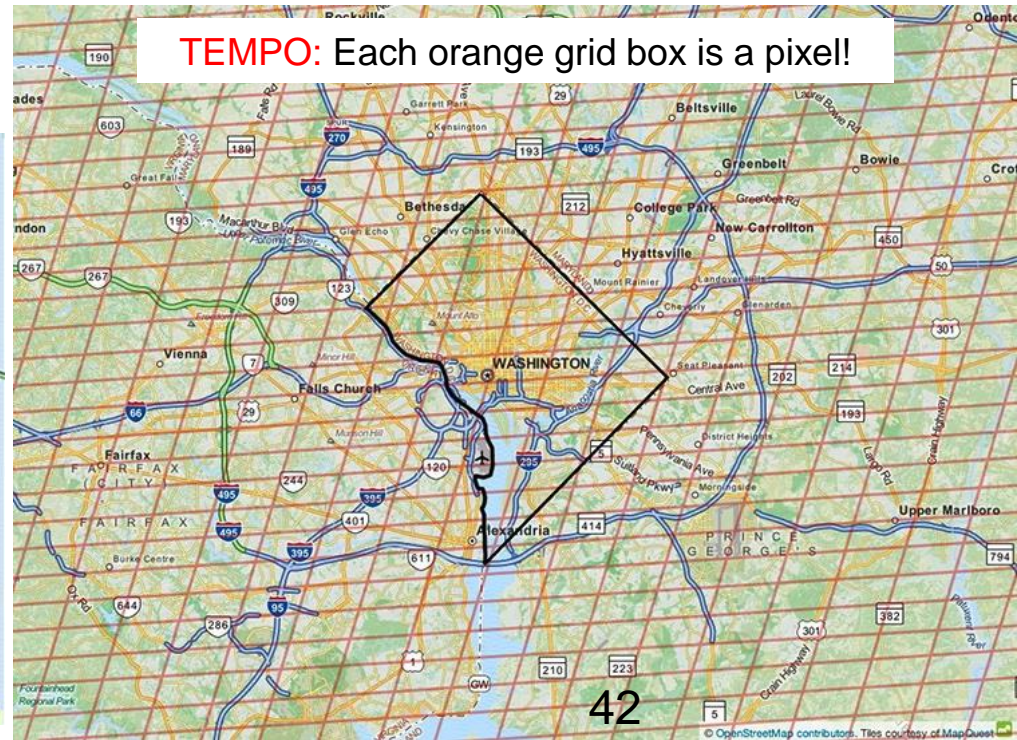

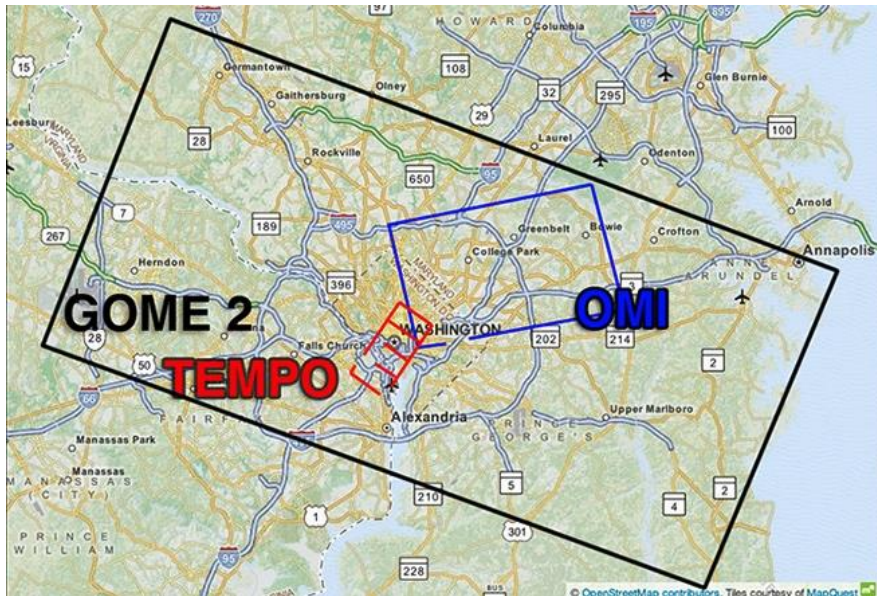

Korea & ESA will each launch their own geosynchronous satellites for air quality.

TEMPO Highlights

- **Launch 2019**
- Observes N. America in daylight hours
- Sub-urban spatial resolution (2 km x 4.5 km)
- *Hourly*: NO₂, ozone (0-2 km vertical), aerosol, clouds
- *3x/day*: formaldehyde, glyoxal, SO₂

Area Observed

Much better spatial resolution than previous satellite instruments.

A satellite image of Earth showing a large semi-transparent white box in the center. The background is a satellite view of a coastal region with brownish land and blue-green water. The text is centered within the white box.

Some Fundamentals

(Things to know about satellite data!)

NASA's Tour of the Electromagnetic Spectrum

A great, easy-to-understand book about how satellites work.

You can download the pdf file or use the on-line version:

<http://missionscience.nasa.gov/ems/>

You can also look at an informative video:

<https://www.youtube.com/watch?v=HPcAWNIVI-8>

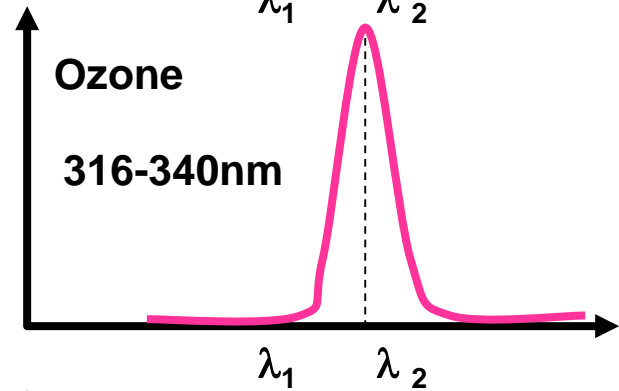

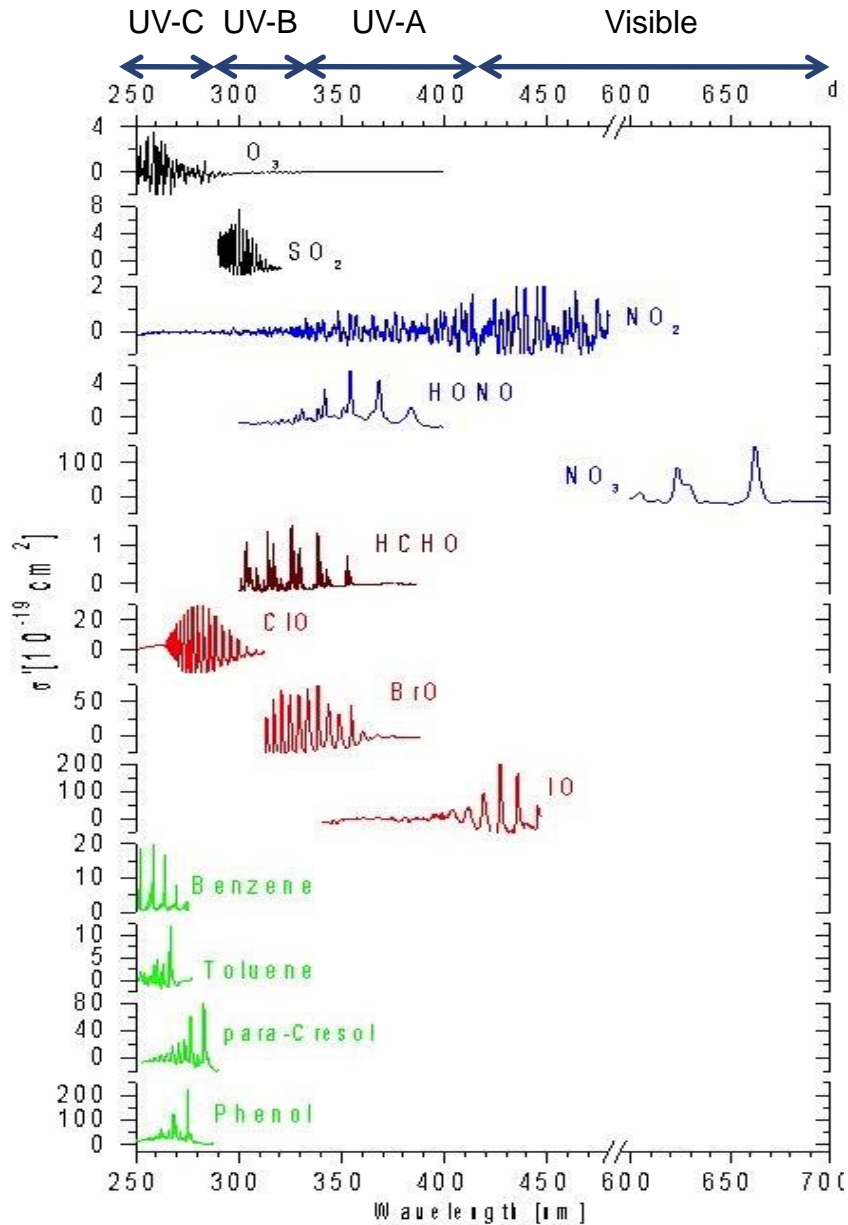

How Satellites Measure Trace Gases

Unlike remote sensing of aerosols, which use the signature of aerosol scattering, remote sensing of trace gases uses the signature of gas absorption

Satellite Measurements Take Advantage of Distinct Absorption Spectra

To summarize ...

1. Satellites detect backscattered solar radiation and/or emitted thermal radiation
2. We know the distinct absorption spectra of each trace gas
3. By knowing how and by what amount different molecules absorb radiation at different wavelengths, we can identify a “fingerprint” for each atmospheric constituent
4. Based on the radiation measured by the instrument, retrieval algorithms are used to infer physical measurements (such as number density, partial pressure, column amount) of different gases

Limitations to Consider

Sensors have limited sensitivity:

- *Spectral limits in interference*
- *Clouds interfere*
- *Aerosols interfere*
- *Limited sensitivity in parts of the vertical column of the atmosphere*
- *Lack of data for validation*

Trace gas concentrations vary throughout the atmosphere due to:

- *Meteorology/Transport*
- *Chemistry (gas, heterogeneous)*
- *Polluted vs. non-polluted regions*
- *Exceptional events*

Proper Use of Remote Sensing Products Requires Knowledge of:

- Column and/or layer product
- Where in the column there is sensitivity
- If it is a layer product, what the vertical resolution of the layers is
- How the products average horizontally, vertically and temporally
- Product and pixel resolution
- Product coverage
- Measurement frequency
- Overpass time

Final Remarks

Satellite data are powerful for health and air quality applications.

However, it is very important to understand the strengths and limitations of the data for a particular application.

Without proper knowledge, it is very easy to misuse and abuse the data!

Please do not be afraid to ask for help, information, guidance, etc.

There are many resources available to the data end-user. Make use of them!!!

A satellite-style map of the Pacific Ocean region, showing the western coast of North America, the Gulf of California, and the eastern coast of South America. The map features various shades of blue for the ocean and brown/tan for the land. A semi-transparent grey rectangular box is overlaid on the map, centered horizontally and vertically. Inside this box, the text "NO ASSIGNMENTS" is written in a bold, black, sans-serif font. A thin black horizontal line is positioned directly below the text.
