Huntsville Urban Development: Utilizing NASA Earth Observations to Evaluate Urban Tree Canopy and Land Surface Temperature for Green Infrastructure and Urban Heat Mitigation in Huntsville, AL

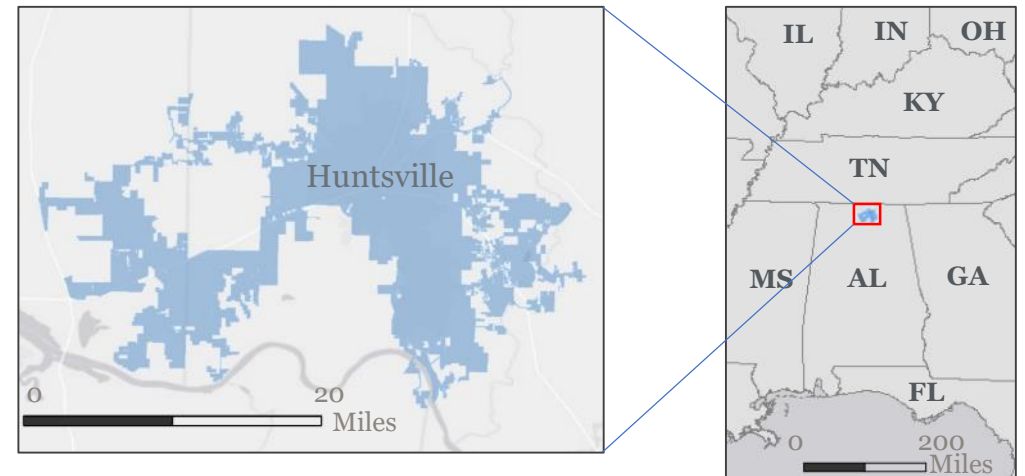

Greta Paris, Sabine Nix, Thomas Quintero, Amanda Tomlinson

COMMUNITY CONCERNS & PROJECT PARTNERS

“20 million hectares of forest are projected to be lost in the United States to **population growth** and associated **urban expansion** by the year 2040.”

- Huntsville, Alabama has experienced rapid **urban expansion** between the years of 2010-2020, and this has citizens concerned about **tree canopy loss**
- Tree canopy loss could be resulting in an enhanced **urban heat island (UHI) effect**
- The UHI effect can lead to **health issues** for those with existing medical conditions such as COPD, diabetes, or asthma.
- The Huntsville Urban Development team partnered with the City of Huntsville to examine the effects of urban expansion on tree canopy loss and the resulting UHI effect

EARTH OBSERVATIONS & METHODS

Terra MODIS

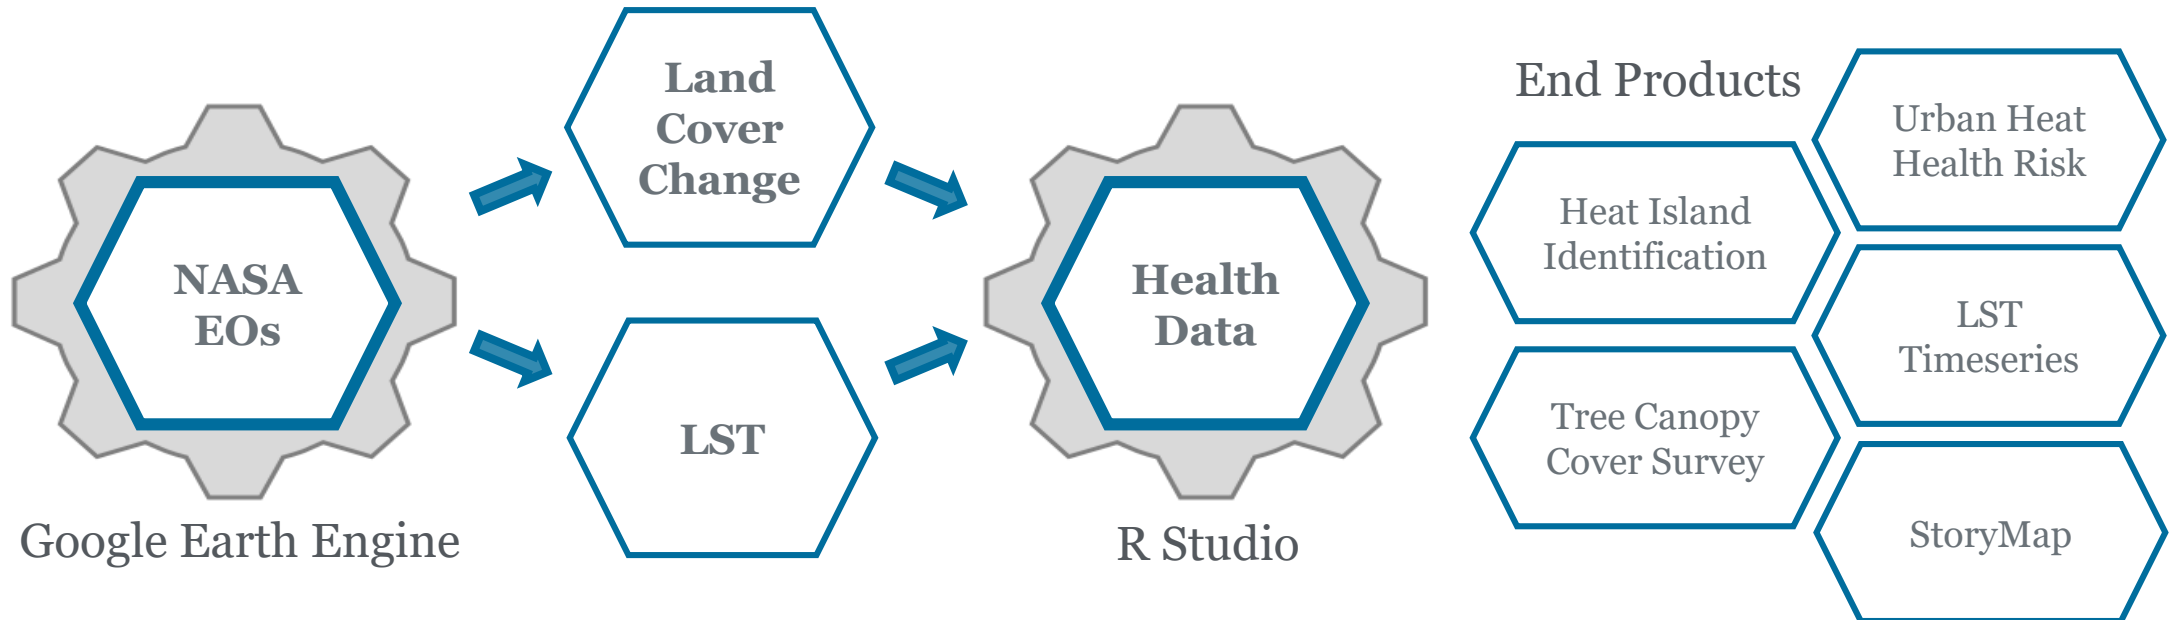

Landsat 5 TM

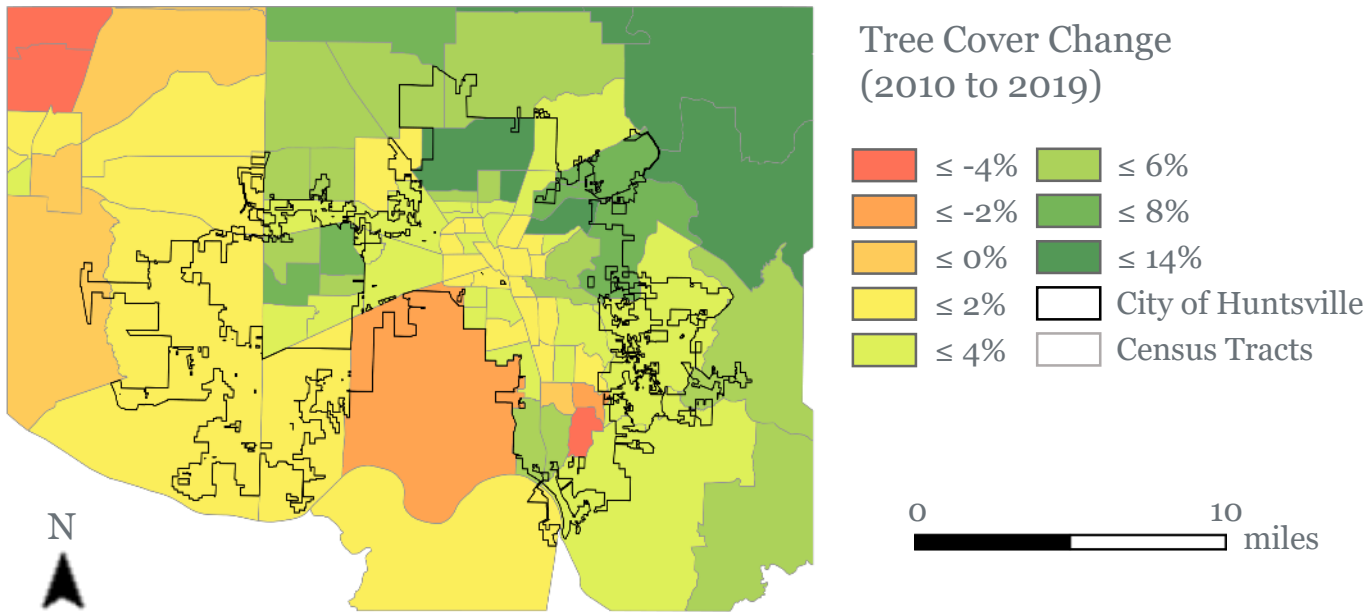

Landsat 8 OLI and TIRS

International Space Station
ECOSTRESS and GEDI

RESULTS & CONCLUSIONS

LST (°F)

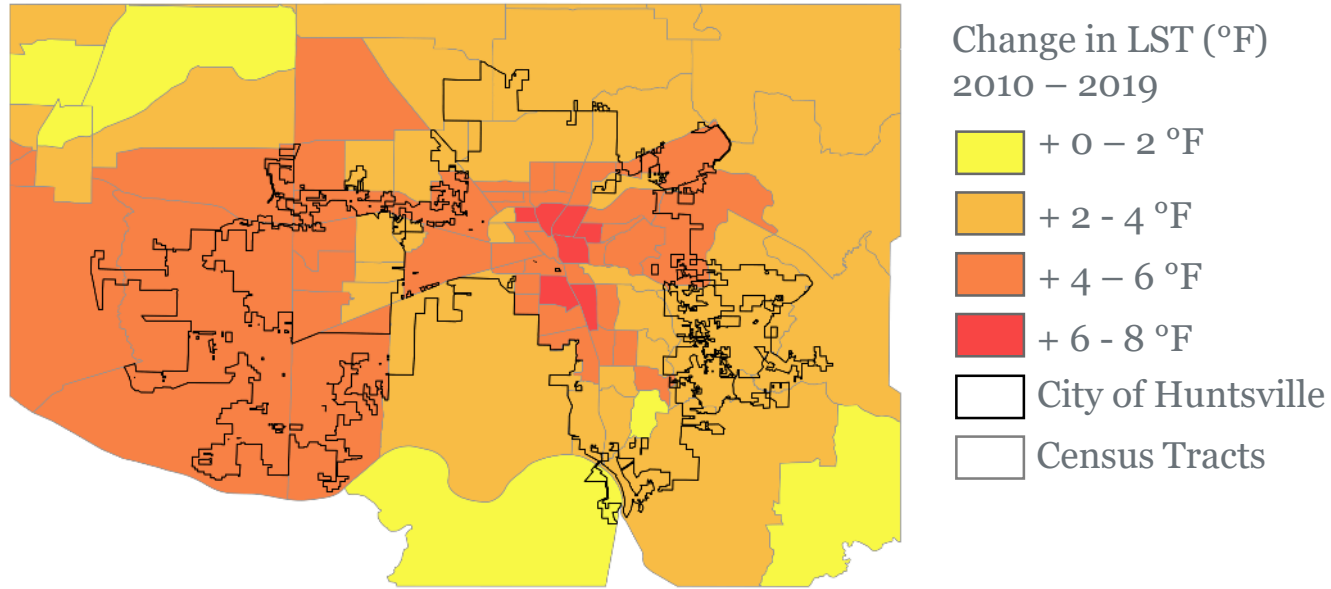

City of Huntsville

0 0.2 miles

- From 2010 to 2019, overall tree cover increased 3% while some census tracts experienced **tree cover loss** as much as 8%.
- The 2019 mean **tree height** in the city area was 82 feet and mean Plant Area Index was 3.
- Land surface temperature **decreases** logarithmically with tree cover and increases linearly with impervious surface cover.

RESULTS & CONCLUSIONS

Overall Heat Vulnerability

- Every census tract in Huntsville has experienced an **increase in LST** between 2010 and 2019.
- On average, LST increased by **4 °F** across the study area, with some tracts increasing by up to **8 °F**.
- Based on the Urban Heat Health Risk Map, many of the tracts experiencing the most LST increase are also the most vulnerable.
- Urban Heat Island **mitigation efforts** could be targeted to most vulnerable census tracts to **reduce risk** of heat-related illness.

Scaling Up a Multi-State System for West Nile Virus Forecasting in the United States

Michael C. Wimberly and Justin K. Davis

Department of Geography and Environmental Sustainability

University of Oklahoma

HEALTH &
AIR QUALITY

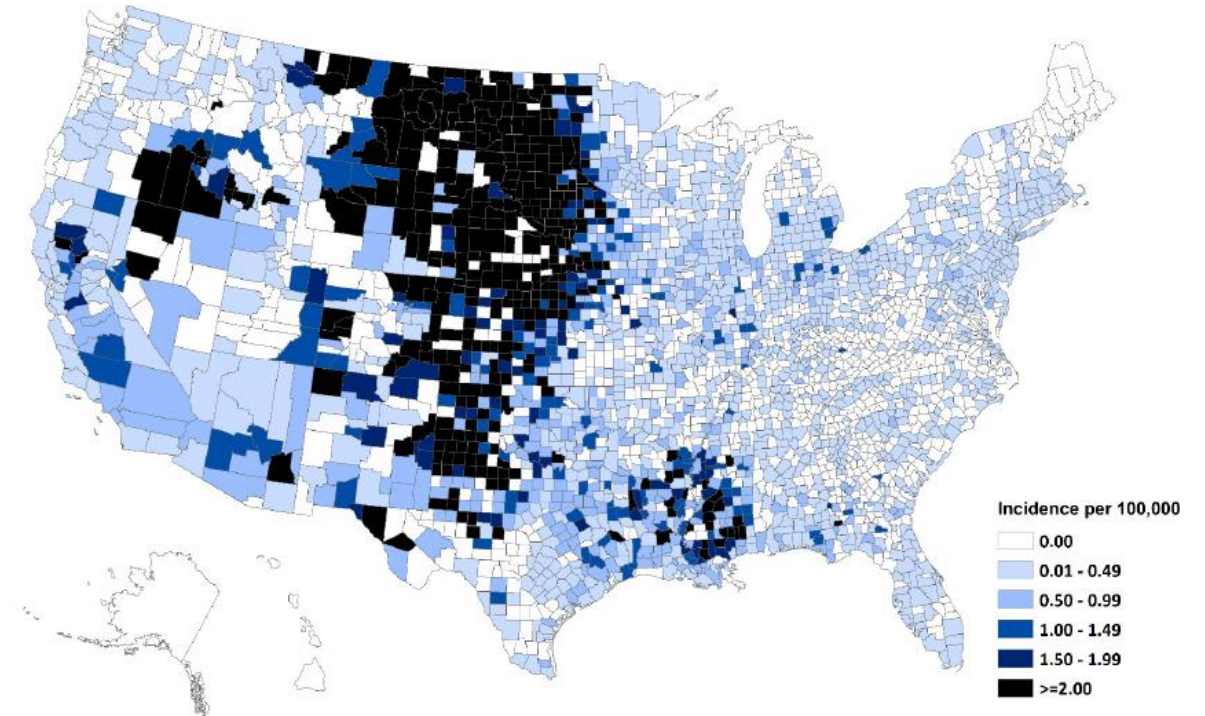

WEST NILE VIRUS FORECASTING

This story about forecasting the risk of a tropical, mosquito-borne disease begins in South Dakota of all places.

- 2,360 cases since 2002
 - 509 Neuroinvasive
 - 46 Deaths
 - 820,000 Population (2010)
- Highest annual incidence of WNV disease (19.4/100,000) in the U.S.
- Seasonal outbreak with high interannual variation
 - 2 cases In 2011
 - 203 cases in 2012

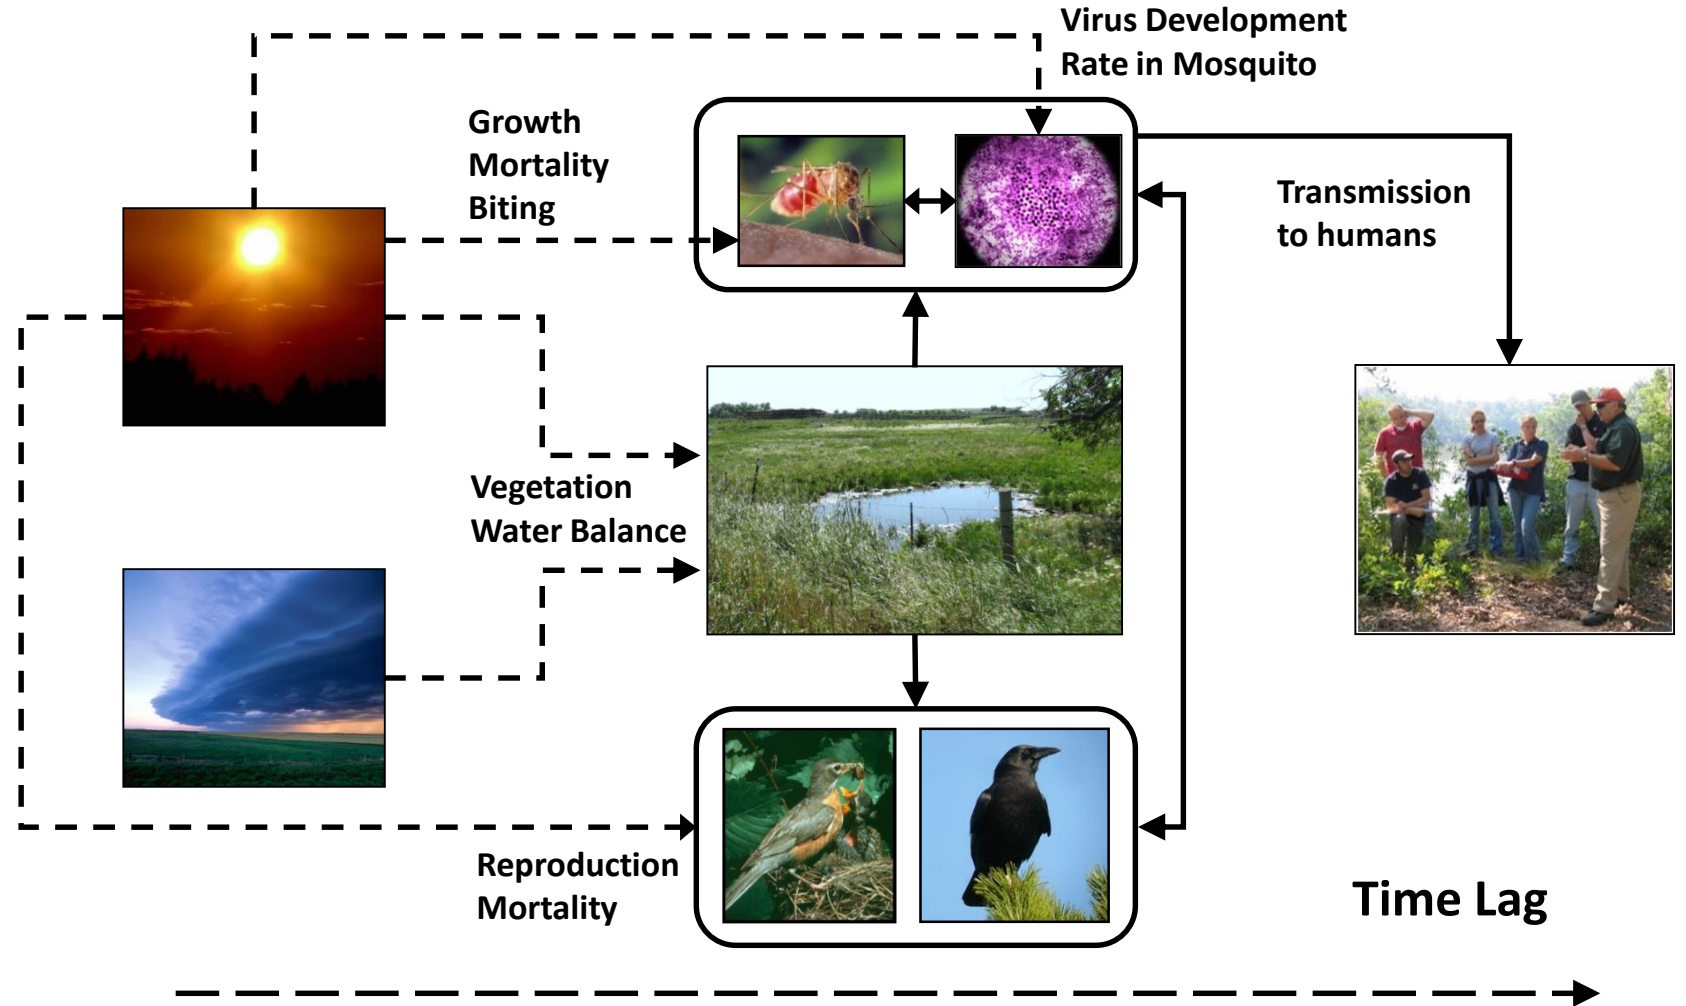

Average annual incidence of West Nile virus neuroinvasive disease reported to CDC by county, 1999-2018

Source: ArboNET, Arboviral Diseases Branch, Centers for Disease Control and Prevention

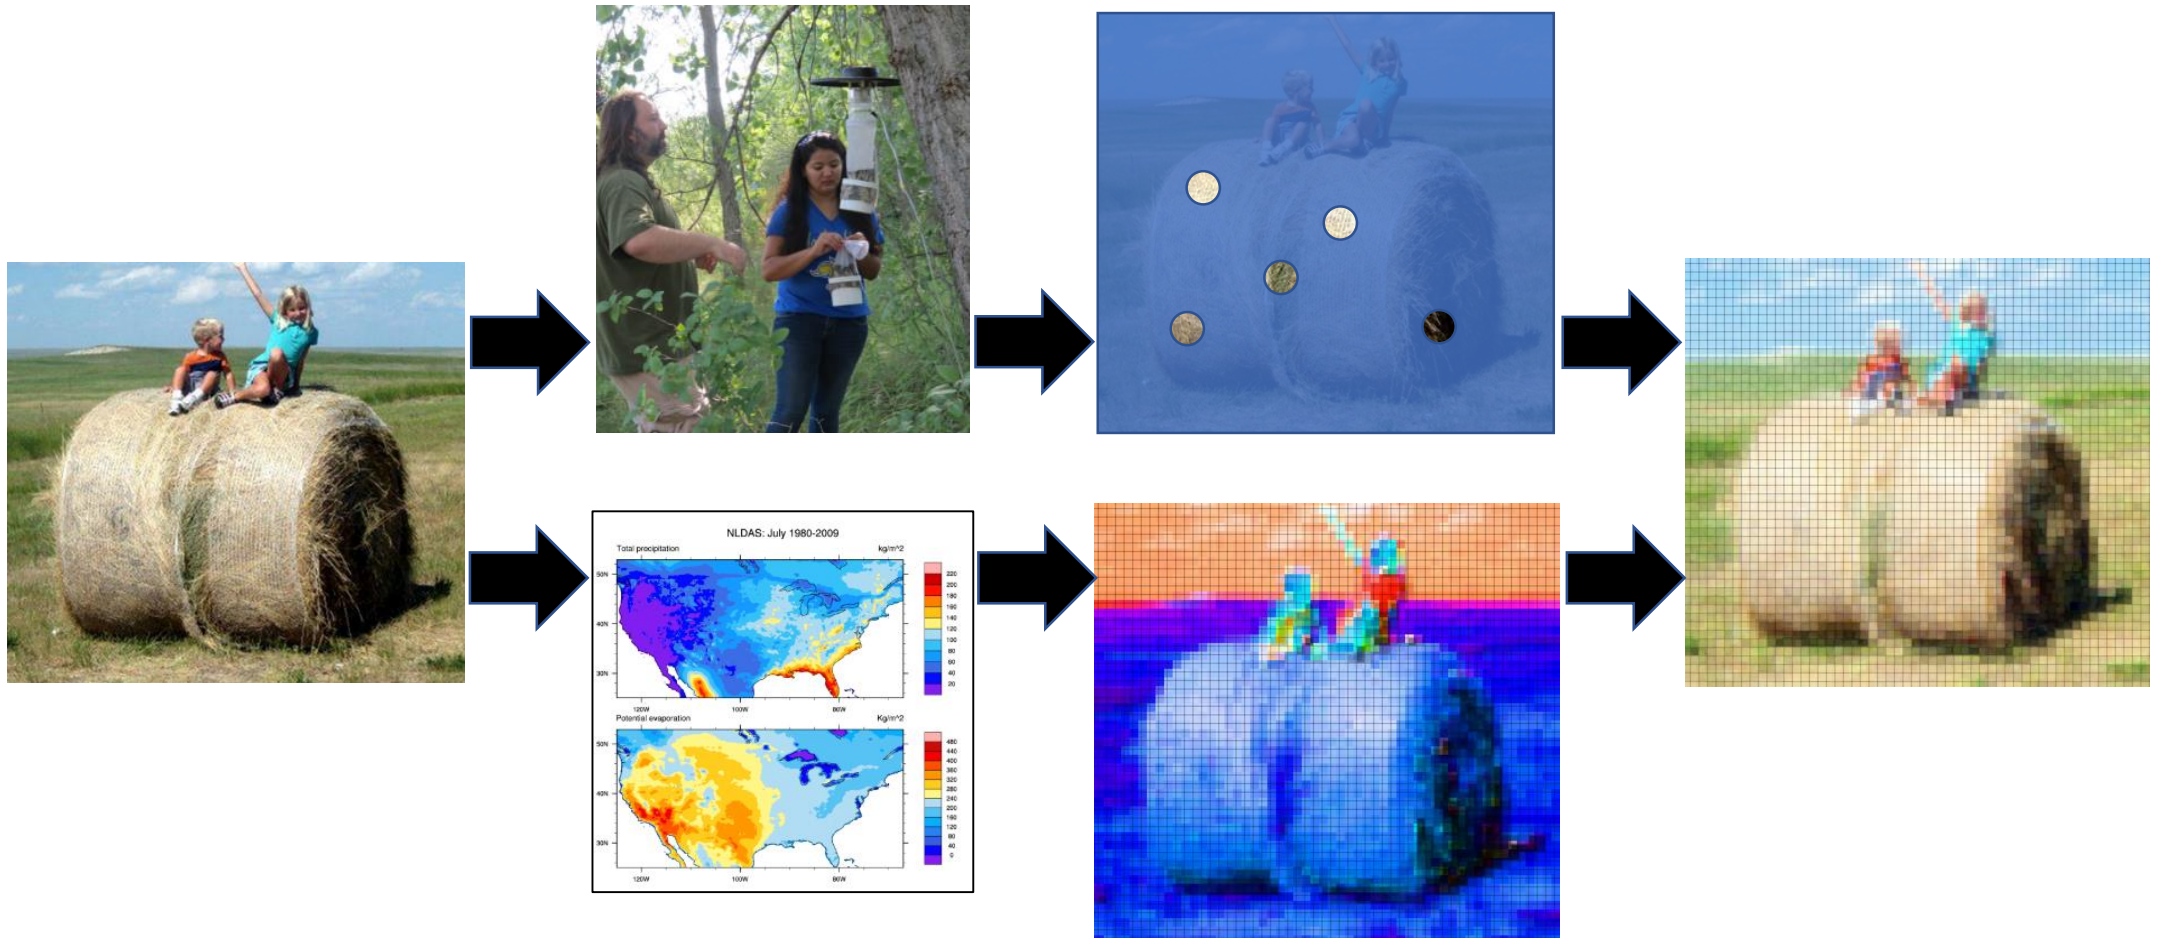

WEST NILE VIRUS FORECASTING

Environmental factors, including temperature, precipitation, and atmospheric moisture, influence WNV transmission through multiple pathways.

WEST NILE VIRUS FORECASTING

ArboMAP integrates environmental monitoring with mosquito surveillance data to improve the accuracy of forecasts.

WEST NILE VIRUS FORECASTING

Combining mosquito infection data with meteorological data results in the most accurate predictions of human WNV cases.

Mosquito infection data

Meteorological data

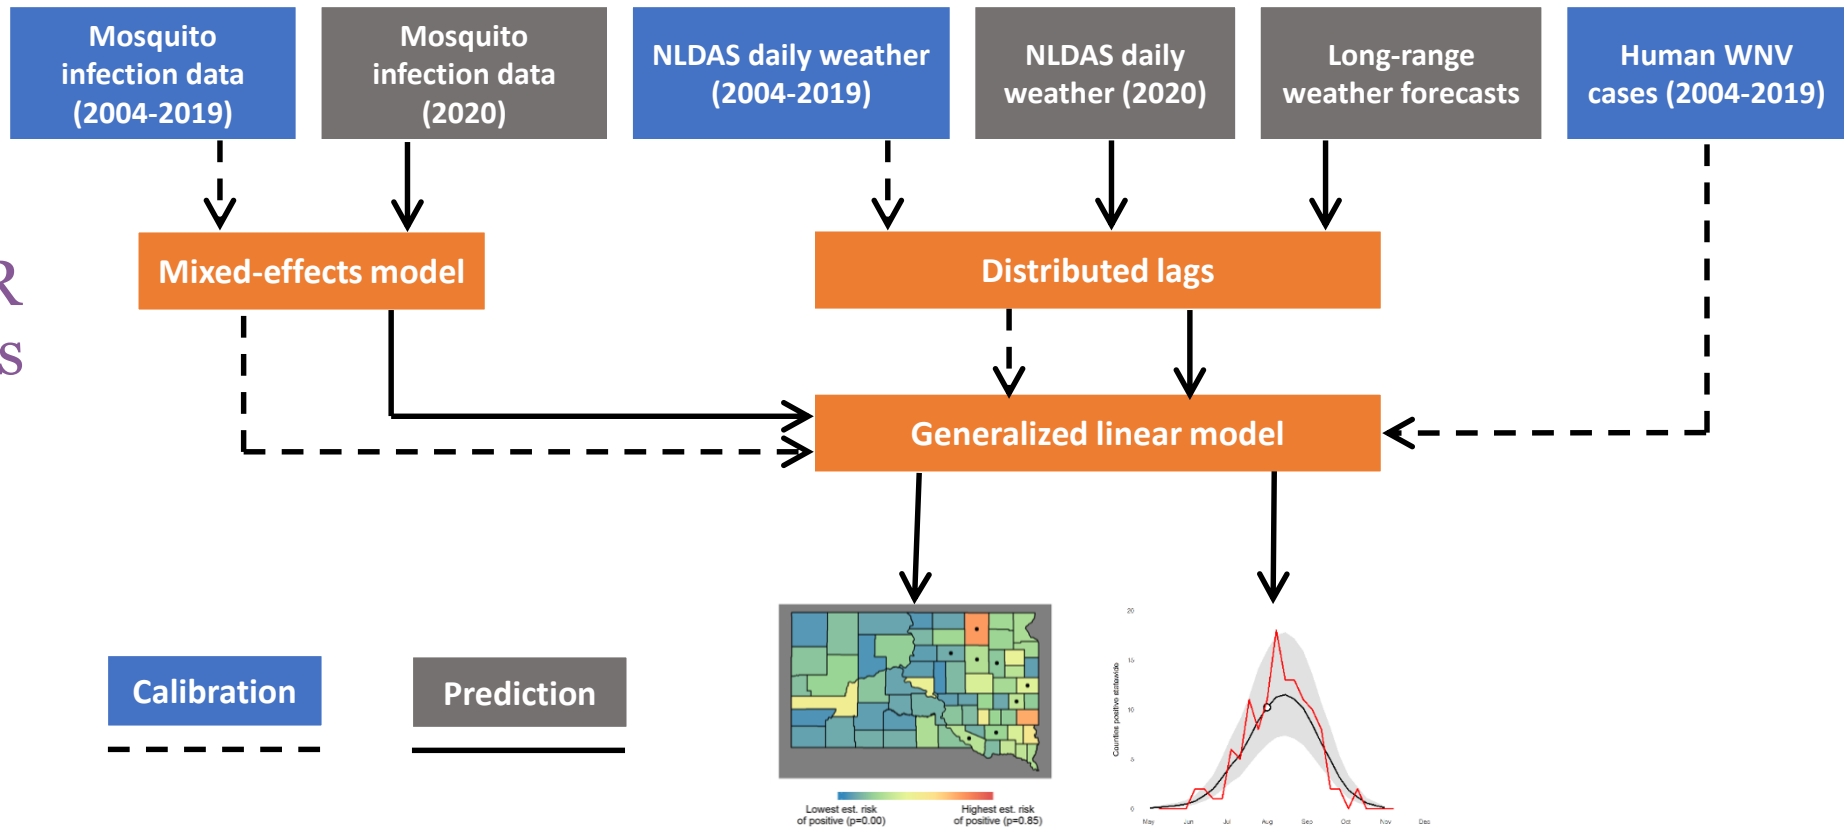

Combined mosquito infection and meteorological data

Model fit from 2004-2016 (each dot represents one year)

WEST NILE VIRUS FORECASTING

ArboMAP is implemented as an R script that automates model fitting, forecasting, and report generation

WEST NILE VIRUS FORECASTING

We have extended ArboMAP forecasts to several new states in 2020.

- South Dakota
 - Continuing to support the SD Department of Health
- Louisiana
 - Focus of current NASA project
 - Virtual collaboration with the LA Department of Health
- Michigan
 - Implemented independently by the MI Department of Health
- Oklahoma
 - Collaboration with Southern Nazarene University and the OKC-County Health Department

2020 West Nile virus forecasts made in mid-July

South Dakota

Louisiana

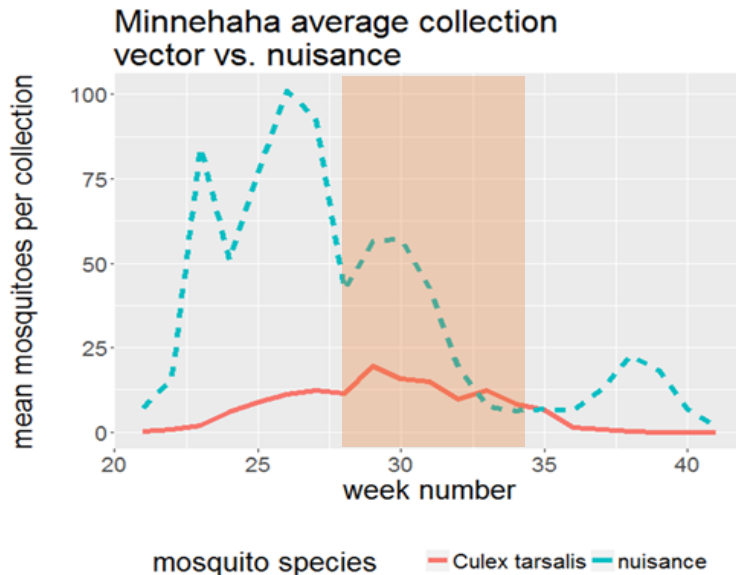

Black line: historical case data

Colored lines: fitted (2004-2019) and predicted (2020) values from an ensemble of forecasting models

WEST NILE VIRUS FORECASTING

ArboMAP is needed to support public health decisions because other sources of information have substantial limitations.

- Reports of human cases are delayed by weeks or months.
- Mosquito abundance is not a reliable predictor of WNV transmission risk.

Most WNV cases in SD occur between weeks 27-34, after the seasonal peak in mosquito abundance.

In 2018, only 8 cases were reported in SD by July 26th, giving the false impression of low WNV risk. In reality, 50 cases had already occurred, and there were 169 cases during the 2018 season – the highest total since 2012.

ArboMAP predicted a higher-than-usual level of WNV risk in early July, indicating a need for aggressive prevention messaging and vector-control.

Satellite Beach Energy: Restructuring the Energy Balance in Satellite Beach, Florida, by Quantifying Solar Energy Production Potential using NASA POWER Data Products and LiDAR

Spencer Nelson*, Katherine Beall, Jake Dialesandro, Julia Marturano

CAPACITY
BUILDING

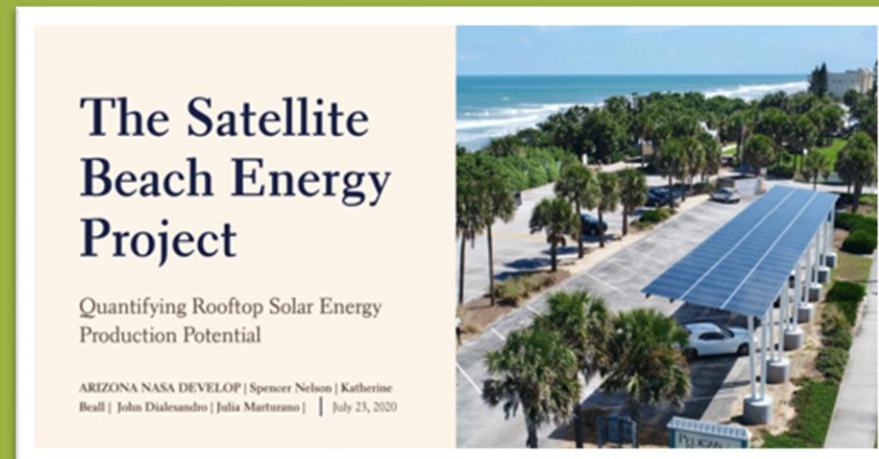

COMMUNITY CONCERS & PROJECT OBJECTIVES

- **Solar Potential** of rooftops
 - Find most efficient way to implement rooftop PV panels
- Reusable **code-based tool**
 - Repeat analysis in other communities
- Accessible **StoryMap**
 - Share with residents of Satellite Beach, Florida

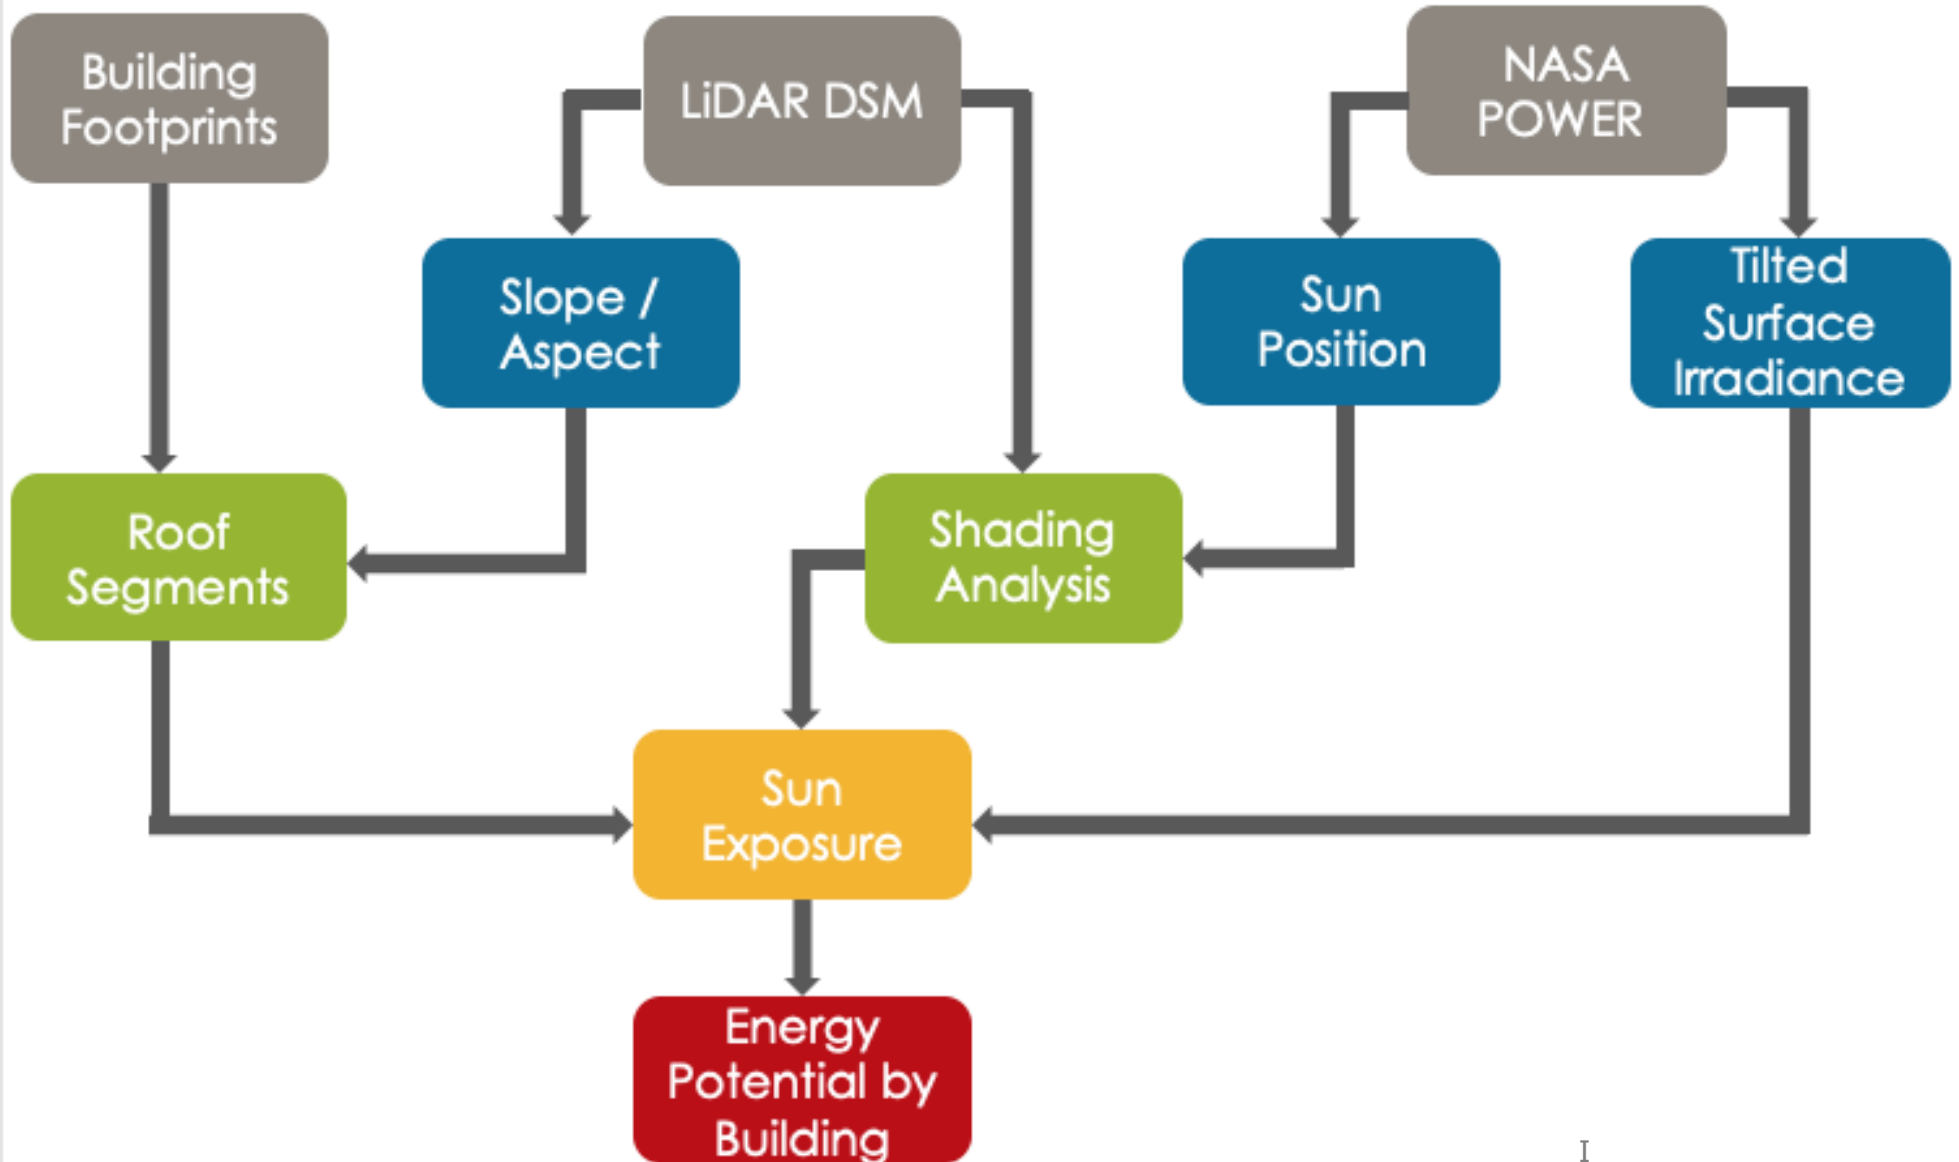

NASA POWER Prediction of Worldwide Energy Resources

100% Renewable Energy by 2050

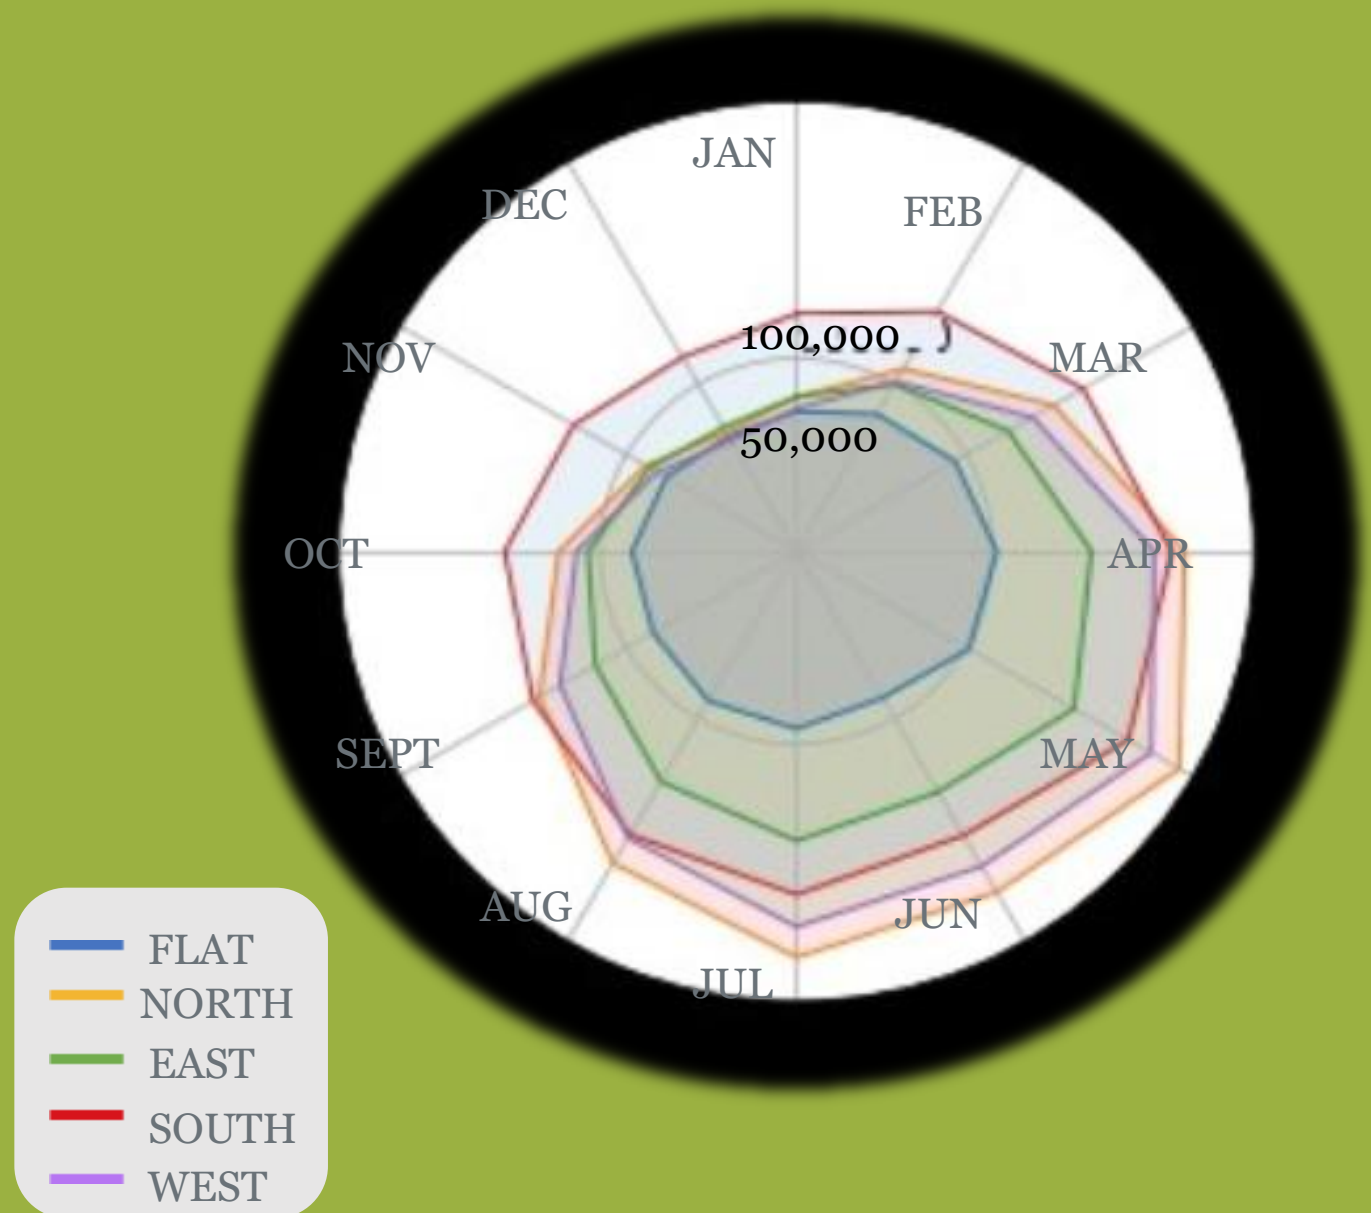

METHODOLOGY & DATA PROCESSING

DAILY ENERGY POTENTIAL OF ROOF SEGMENTS (KWh)

RESULTS AND CONCLUSIONS

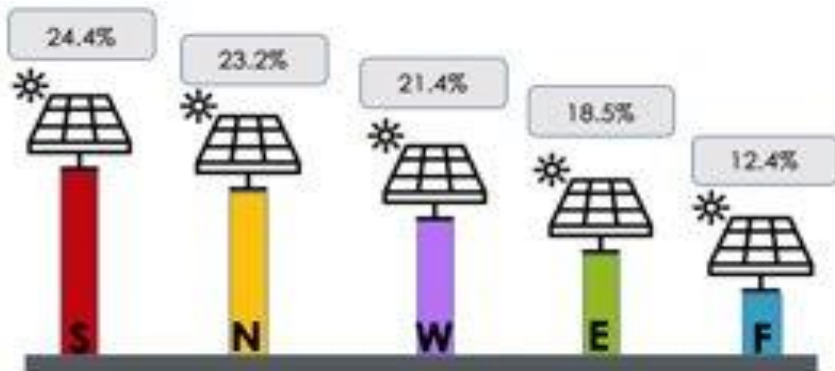

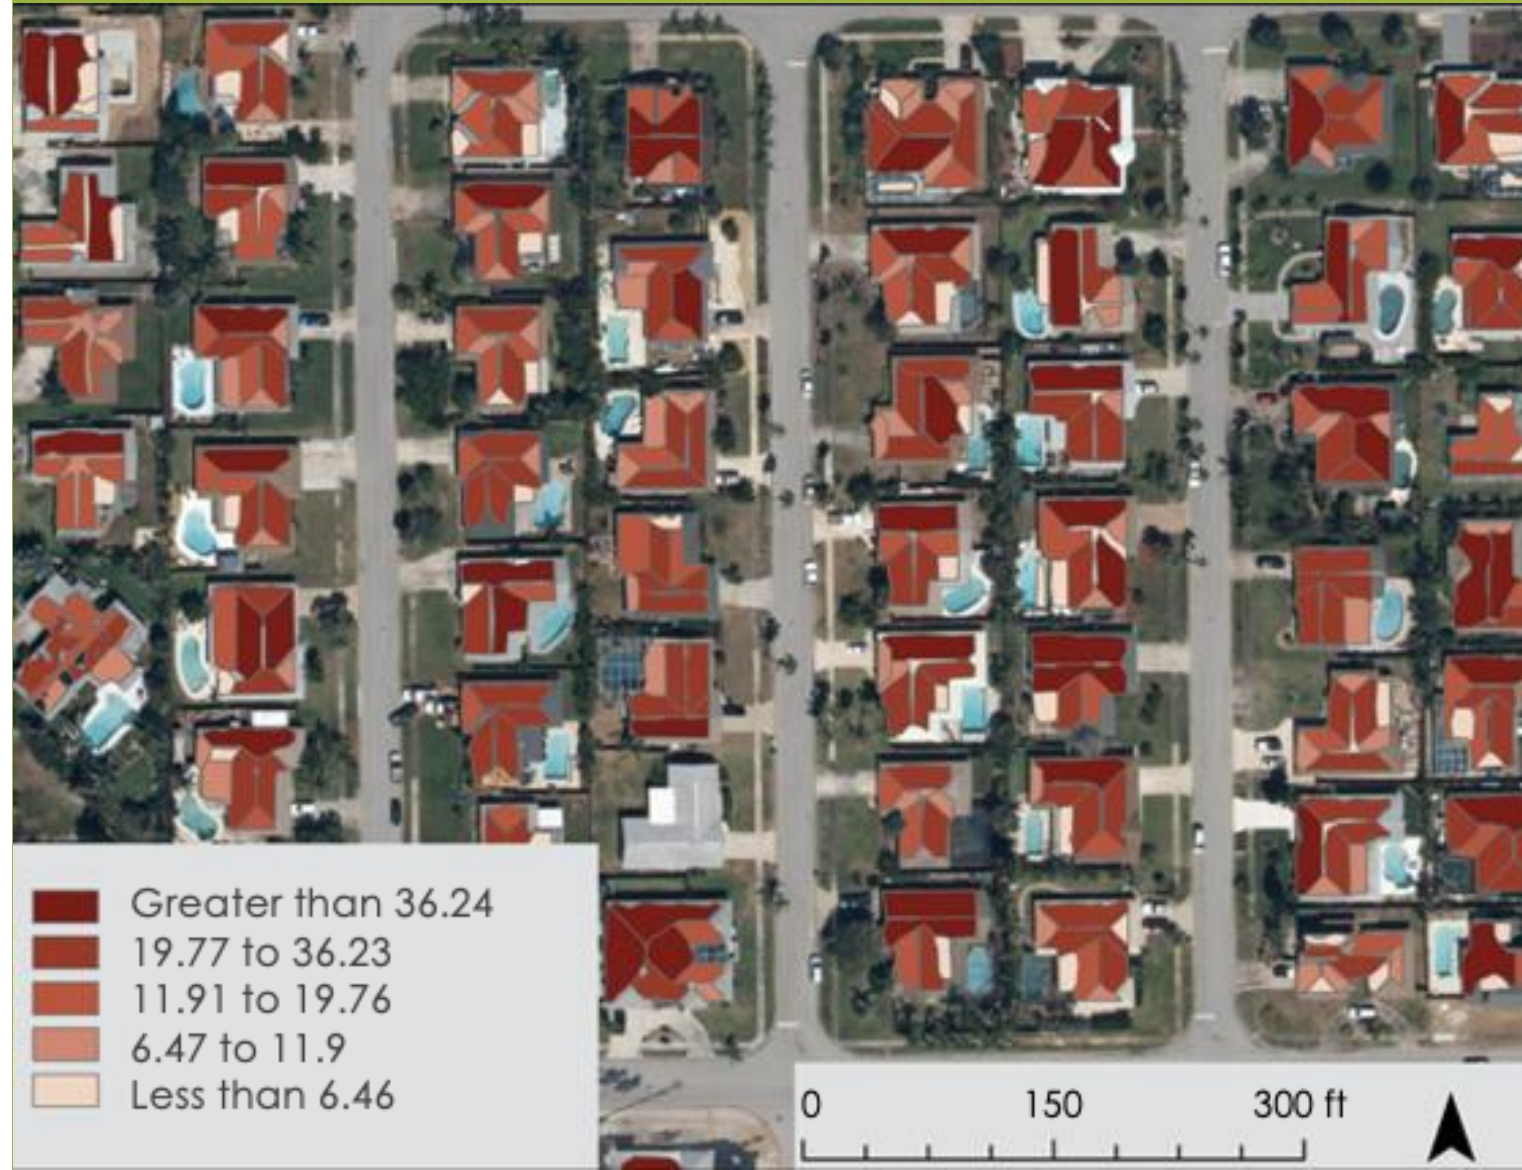

- North-facing roofs produce the most solar potential of all roofs, April-Aug
- May produces the most, December produces the least (44% of May)
- South-facing roofs produce notably more energy during the winter months and greatest annually
- 212,172,448 KWh of PV potential, annually
 - Enough to power nearly 20,000 average homes

RESULTS AND CONCLUSIONS

- Annual PV potential south facing segments: 51,755,072 KWh
 - Average: 11,000 KWh (about average household energy consumption)
- Annual PV potential flat-roof segments: 26,363,411 KWh
 - Average: 5,396 KWh
- Average building PV potential: 55,010 KWh (500% of average household energy consumption)

Annual PV Potential in KWh by Roof Segment

Inform solar panel planning for 100% solar goal

Africa Floods and Cascading Hazards

Maggi Glasscoe

Jet Propulsion Laboratory, California Institute of Technology

DISASTERS

Central and east Africa, particularly the countries of Kenya, Somalia, Sudan, South Sudan, and the Democratic Republic of the Congo, experienced severe flooding this past spring as greater and more widespread than normal rainfall occurred during their “long rains” season.

The NASA Disasters Program activated for this event to investigate the effects of the flood and see how our products might aid in supporting future flooding events.

- During this event Africa experienced transboundary flooding and food insecurity
- Rising waters impacted vulnerable settlements along riverbanks
- News reports indicated hundreds of people losing lives to overflowing rivers and mudslides and thousands of others displaced
- NASA Disasters A.37 “Advancing Access to Global Flood Modeling and Alerting” research project investigated this event

FLOODING IN EAST AND CENTRAL AFRICA SPRING 2020

Advancing Access to Global Flood Modeling and Alerting – Disasters A.37 ROSES Project

Using DisasterAWARE - an open access, global flood alerting system – for effective dissemination of flood risks and potential impacts to aid with emergency response.

The main components of the project are:

- i. A Model of Models (MoM) to forecast flood severity at global scale by integrating flood outputs from two simulation models – GloFAS and GFMS in near real-time;
- ii. Derive inundation outputs from Earth observation data sets in the MoM for validation and calibration;
- iii. Implement machine learning based flood damage assessment pipeline to generate impact outputs for vulnerable locations;
- iv. Implement an end-to-end pipeline integrating the above-mentioned components.

Central to the project is the incorporation of flood model outputs and remote sensing derived products from multiple platforms to help with flood risk mitigation and increase resilience of impacted communities.

Number of Floods during 2000 – 2019

Source: <https://www.emdat.be/>

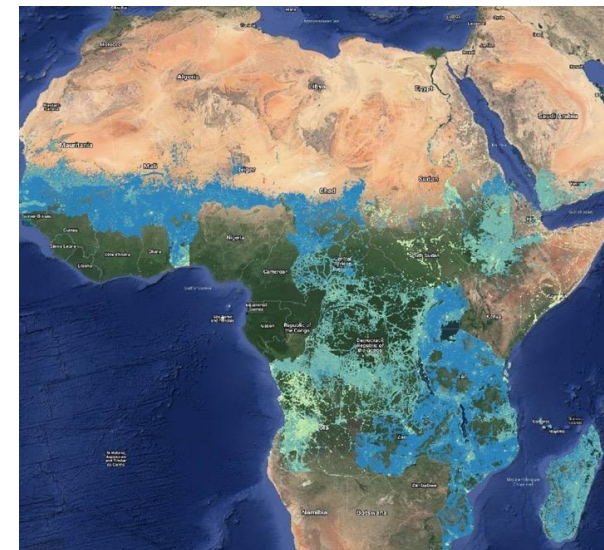

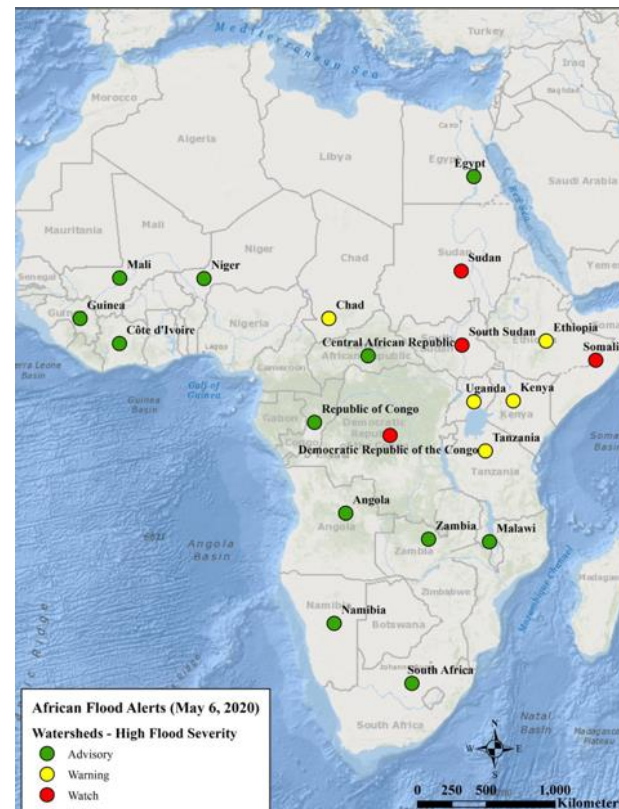

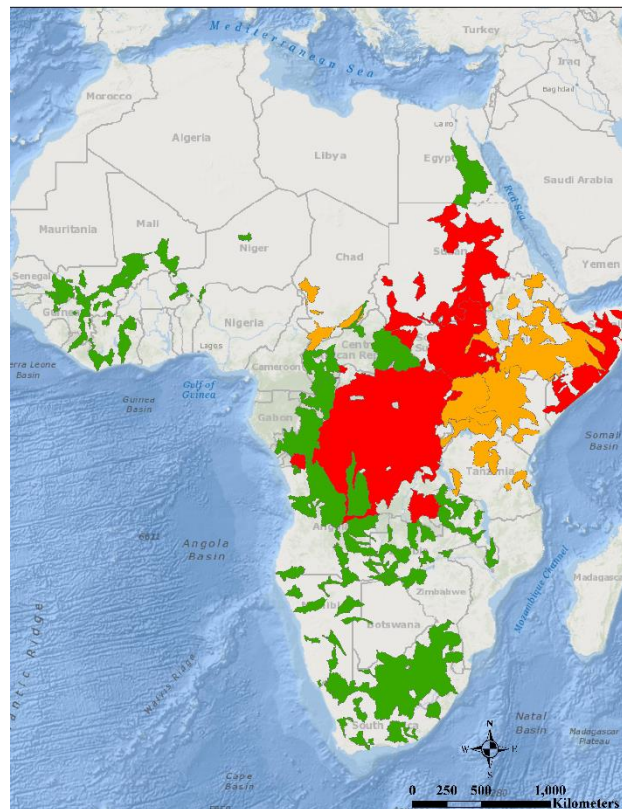

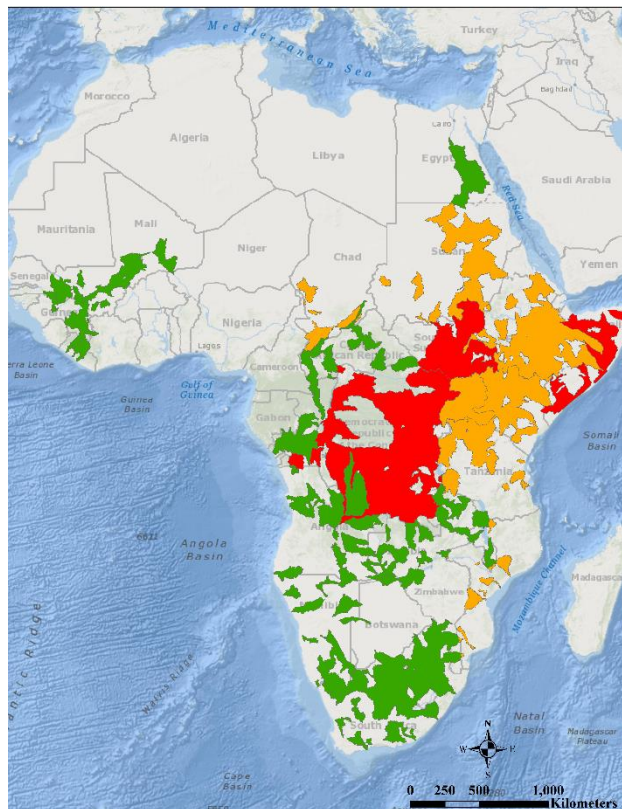

Continent Level Flood Damage (in USD Billion) During 2000 – 2019

Source: <https://www.emdat.be/>

FLOODING IN EAST AND CENTRAL AFRICA SPRING 2020

The NASA Disasters [ROSES A.37 Applied Science research project](#) “Advancing Access to Global Flood Modeling and Alerting” examined the regional flood event in Africa as a case study for testing the capabilities of their flood modeling and alerting system. The system combines model outputs from the Global Flood Monitoring System ([GFMS](#)) and the Global Flood Awareness System ([GloFAS](#)) with data on watershed risk, which is then validated using Synthetic Aperture Radar (SAR) data for flood inundation and depth, if available.

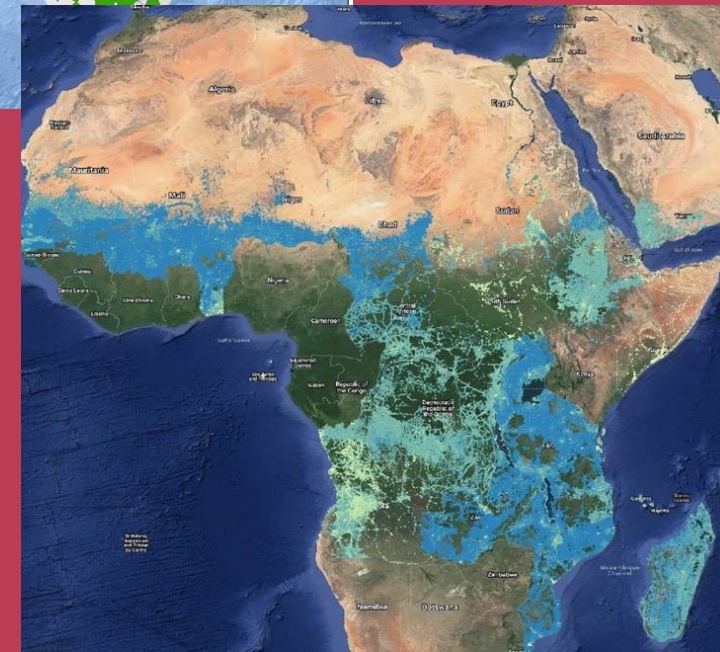

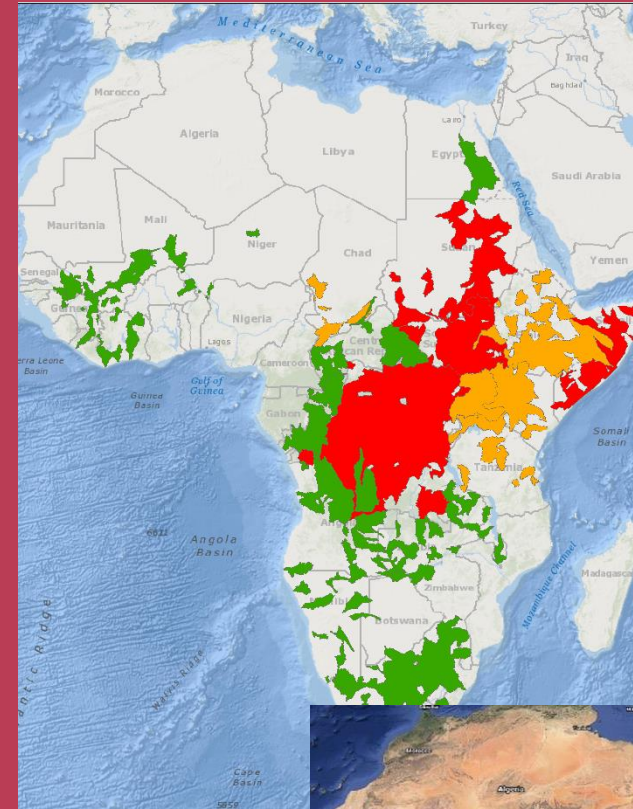

These data are being integrated into the Pacific Disaster Center (PDC) [DisasterAWARE®](#) multi-hazard monitoring, early warning, and decision support platform providing an automated source of global information on floods that is supported by a common, normalized data model.

Watersheds (a, b) that are experiencing watches (red), warnings (orange), or advisories (green) are converted into alerts (c) that will be delivered to DisasterAWARE®. Exposure (d) can then be overlaid to show areas of vulnerability.

FLOODING IN EAST AND CENTRAL AFRICA SPRING 2020

- Flooding in Africa led to exposure/risk to vulnerable populations and infrastructure
- Oftentimes these risks are compounded by multiple associated events – heavy rainfall causing both flooding and landslides
- These events both lead to exposure/risk to vulnerable populations and infrastructure
- <https://disasters.nasa.gov/africa-flooding-2020>

FLOODING IN EAST AND CENTRAL AFRICA SPRING 2020

- Disasters A.37 ROSES projects:
 - Solicited proposals for user-centric applications research enabling risk-informed decisions and actions
 - Multidisciplinary projects which harness the convergence of expertise and collaborative partnerships.
- Bringing together three A.37 teams, we would like to investigate how cascading hazards evolve in an event
- Leveraging each of the project's expertise, we will conduct a study on an event that demonstrates these cascading hazards and allows us to investigate associated exposure
- Three projects are actively collaborating on a potential case study:
 - Advancing Access to Global Flood Modeling and Alerting
 - Development of Predictive Models to Improve Landslide Disaster Risk Reduction and Response
 - Identifying Critical Infrastructure Exposure for Disaster Forecasting, Mitigation and Response
- <https://disasters.nasa.gov/portfolio>

Floods and landslides can be cascading events that lead to exposure to vulnerable populations and infrastructure.

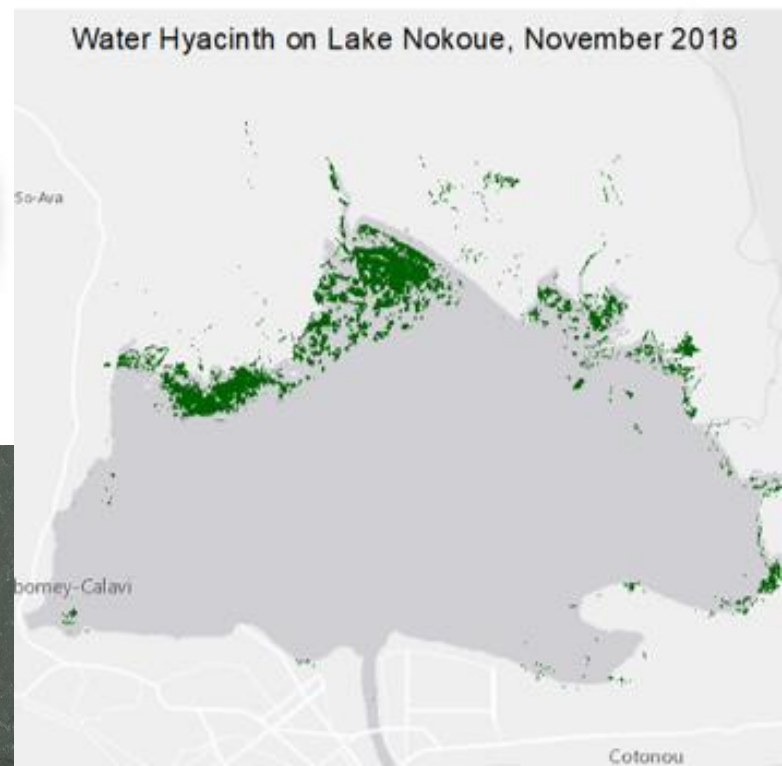

Thank You.

Green Keeper
Africa

Water Hyacinth Surface Area Extent

A Flower Against Pollution

How we are collaborating with Green Keeper Africa to monitor an invasive plant that is used to clean oil-based waste

Green Keeper Africa

Green Keeper Africa is an entrepreneurial company based in Cotonou, Benin. They pay local community members to harvest the invasive water hyacinth plant and convert it into kits that absorb oil pollution caused by industry. Their work improves the environment and creates a new eco-friendly source of income. Green Keeper Africa has invited Space Enabled to work together to create an Observation System for Invasive Plants to monitor the water hyacinth and its impact on the community.

Satellite Earth Observation

Space Enabled is working with Green Keeper Africa to use imagery and measurements from earth observation satellites to monitor the water hyacinth. We are combining information from government and commercial satellites that show how the water hyacinth grows and drifts through rivers and lakes.

Aerial Earth Observation

Space Enabled is exploring with Green Keeper Africa how they might use cameras mounted on radio controlled planes, drones, solar air balloons or kites to track the growth of the invasive water hyacinth plant.

Measuring

The growth of the invasive water hyacinth plant is impacted by environmental factors such as the temperature, salinity and nutrient content of the water as well as local weather patterns. Space Enabled is working with Green Keeper Africa to explore how they can use sensors placed in local water ways to measure environmental changes. In the long term, these measurements may help Green Keeper Africa predict where the invasive water hyacinth plant will bloom.

Earth Science Data System Program (ESDS)

The Earth Science Data System Program is an essential component of the Earth Science Division and is responsible for:

- **Actively** managing NASA's Earth science data (Satellite, Airborne, and Field).
- Developing **unique** data system capabilities optimized to support rigorous science and applied science users.
- **Processing** (and **reprocessing**) instrument data to create high quality long-term Earth science data records.
- Upholding NASA's policy of **full and open sharing** of all data, tools, and ancillary information for all users.
- **Engaging** the Earth science community in the evolution of data systems.
- Providing high quality **user services and training** for researchers and applied scientists.

The Earth Science Data and Information System (ESDIS) project/GSFC maintains and operates a data and information system. The Inter-Agency Implementation and Advanced Concepts Team (IMPACT) at MSFC supports the ESDS Program and collaborates with ESDIS project.

Decision Making
Process

MOTIVATION

- Florida has distinct wet and dry seasons
- Historically, most of Florida was dependent on groundwater for municipal supply
- Utilities are now using multiple sources to minimize environmental impacts of over-extraction of groundwater, e.g.:
 - Aquifer Storage and Recovery (ASR)
 - River withdrawals, off-line reservoirs, desalination plants
- How to use the right source of water at the right time in order to minimize costs and environmental impacts?

PROGRESS YEAR 1

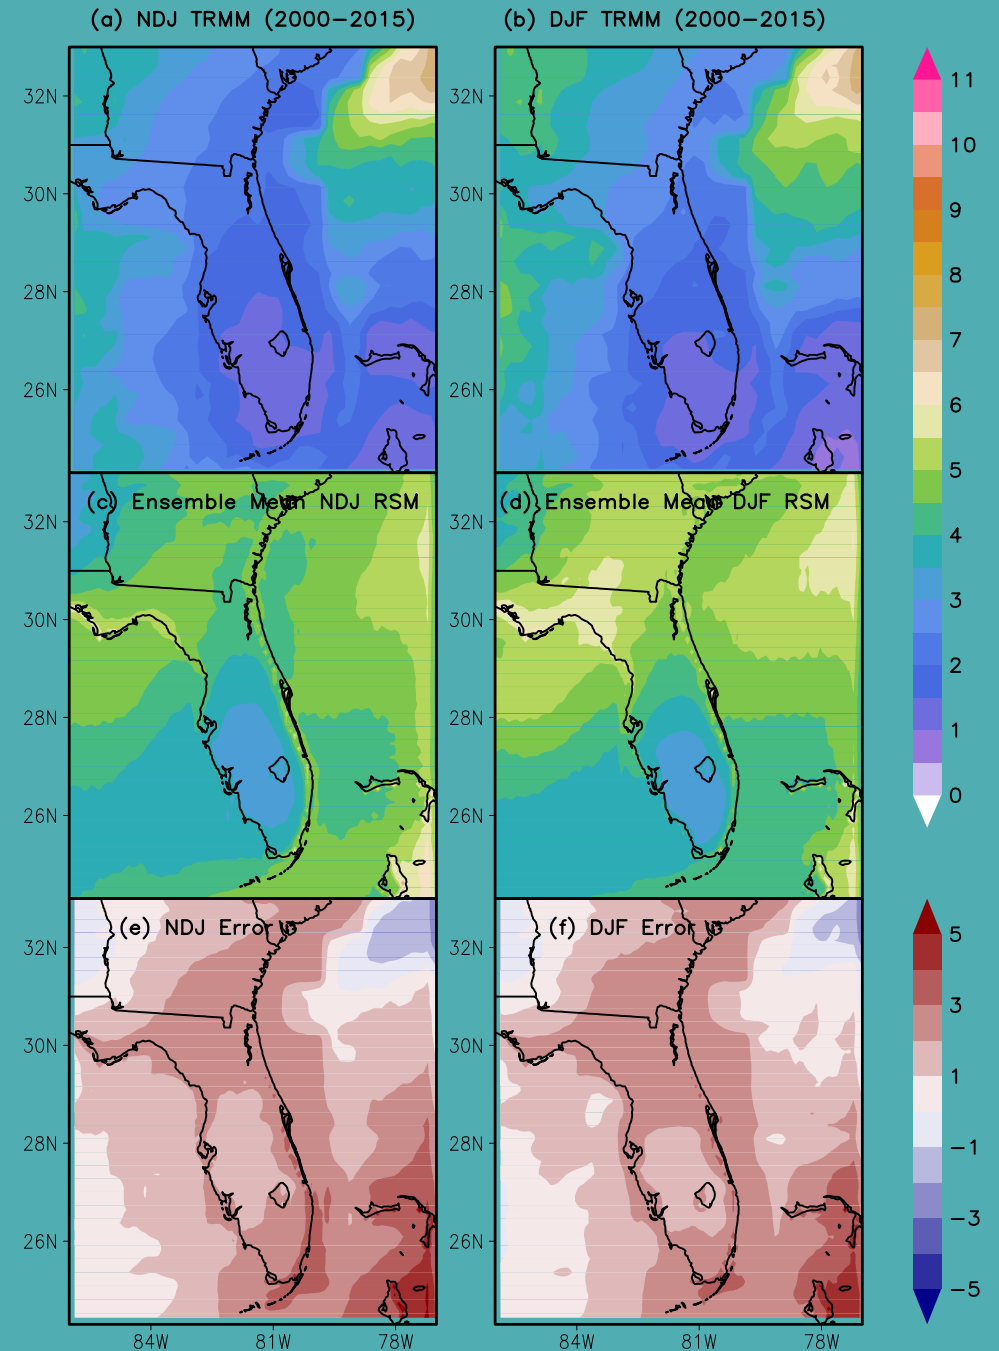

- 2000-2019 Regional Climate Forecasts for:
 - November, December, January
 - December, January, February
 - 10 km resolution
- 5 Global Climate Models (GCMs) x 6 Regional Climate Model (RCM) forecasts = 30 ensemble members
- Daily and Monthly Data for **32 variables** are available at:

https://data.coaps.fsu.edu/pub/abhardwaj/PR/G_RSM/

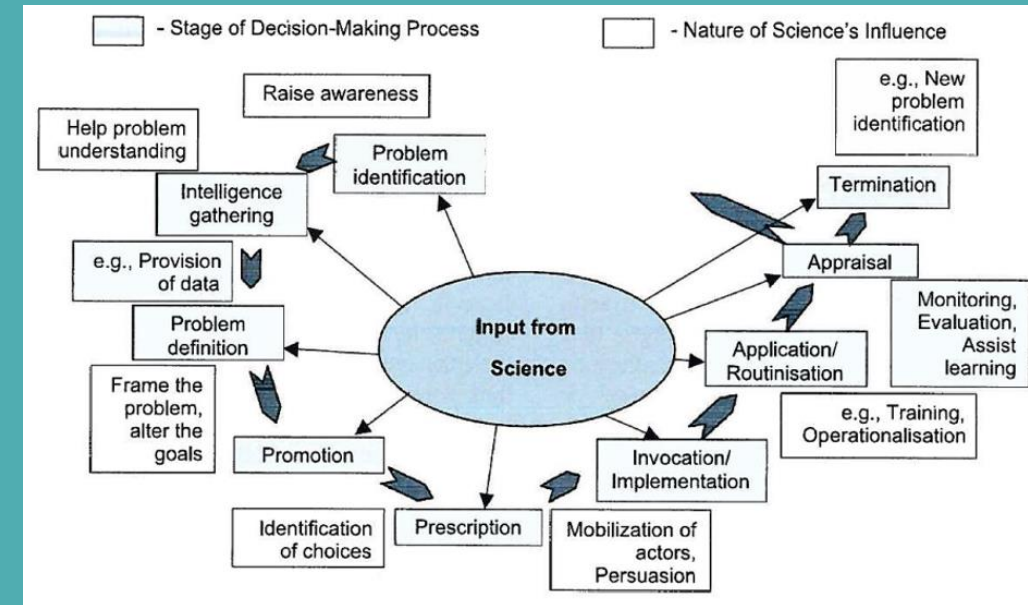

PROGRESS YEAR 1

- Seasonal Mean precipitation for November-January and December to February forecasts compared to TRMM precipitation
 - Top row: TRMM precipitation
 - Middle row: Mean regional climate forecasts
 - Bottom row: Error between forecasts and TRMM
- These forecasts will be the baseline to compare improvement of Regional Climate Forecasts initialized with remotely sensed soil moisture

INTEGRATION OF FORECASTS INTO OPERATIONS

- Multiple hydrologic models
 - Statistical and Physical
- Aquifer Storage and Recovery (ASR) Index
 - Multiple inputs (including drought status, current streamflow, and Climate Prediction Center outlooks)
 - When to turn on the ASR wells?
- Assessment of the process, implementation and effectiveness of integration into decision-making
 - Where, and how does scientific input have an impact on adoption?
 - Don't "Build it First" and then hope it gets used...
 - What are the impacts of our champions?

Riley County Water Resources: Comparing Curve Calculation Methods to Inform Local Resiliency Initiatives in Riley County, Kansas

Trista Brophy, Ella Griffith, Elizabeth Nguyen, Adelaide Schmidt

COMMUNITY CONCERNS AND PROJECT PARTNERS

Community Concerns

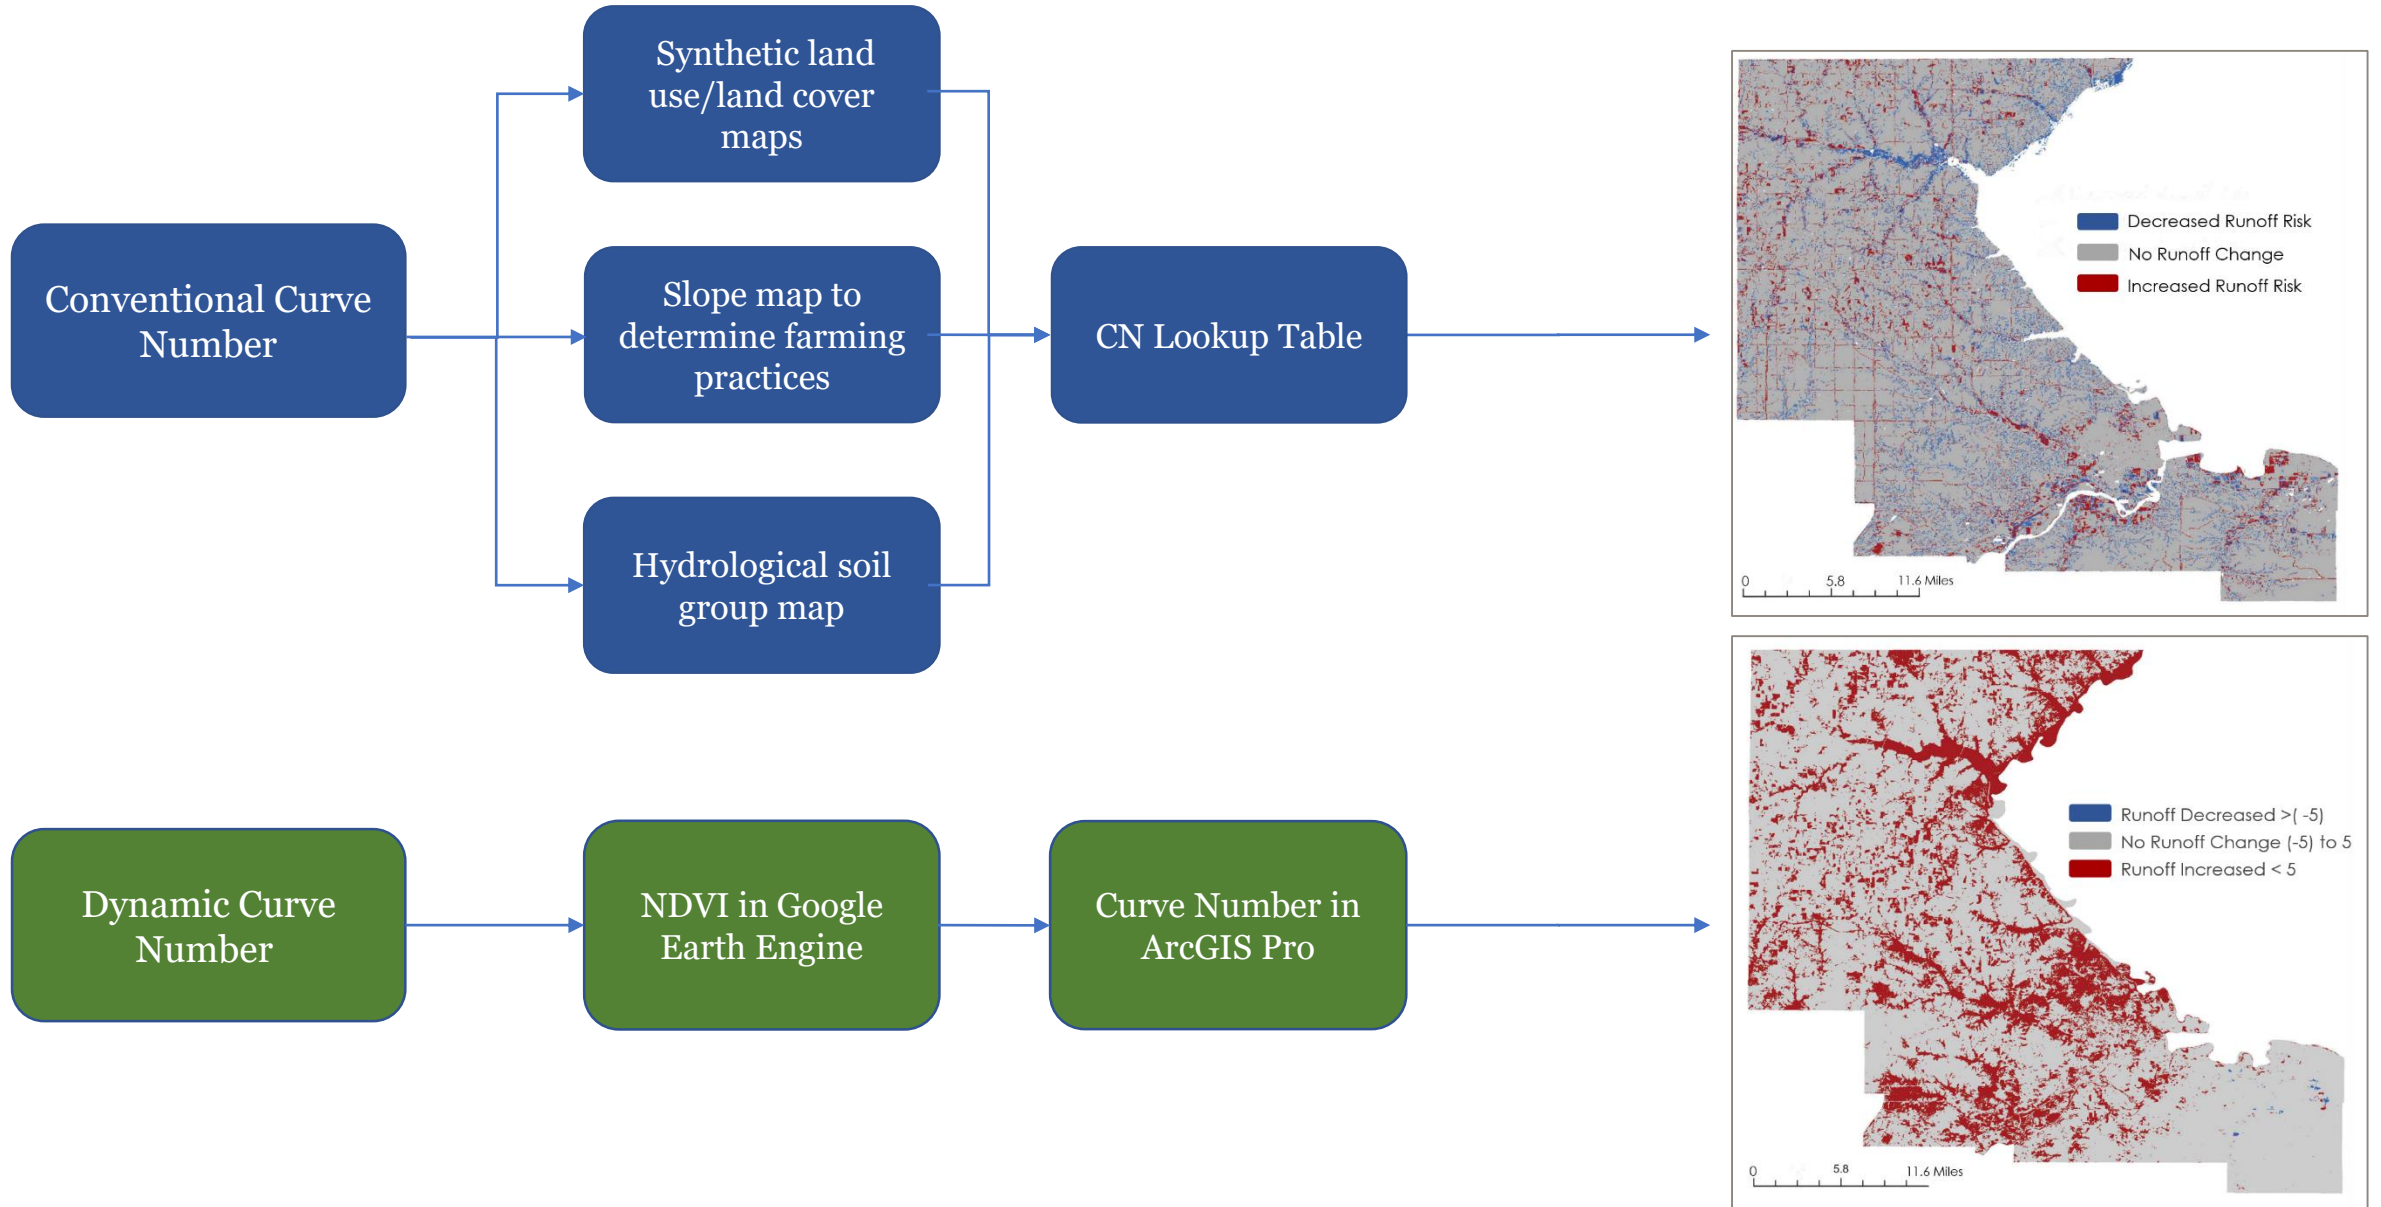

- Flooding
- Increased surface runoff
- Changes in land use and land cover (LULC)

Project Partners

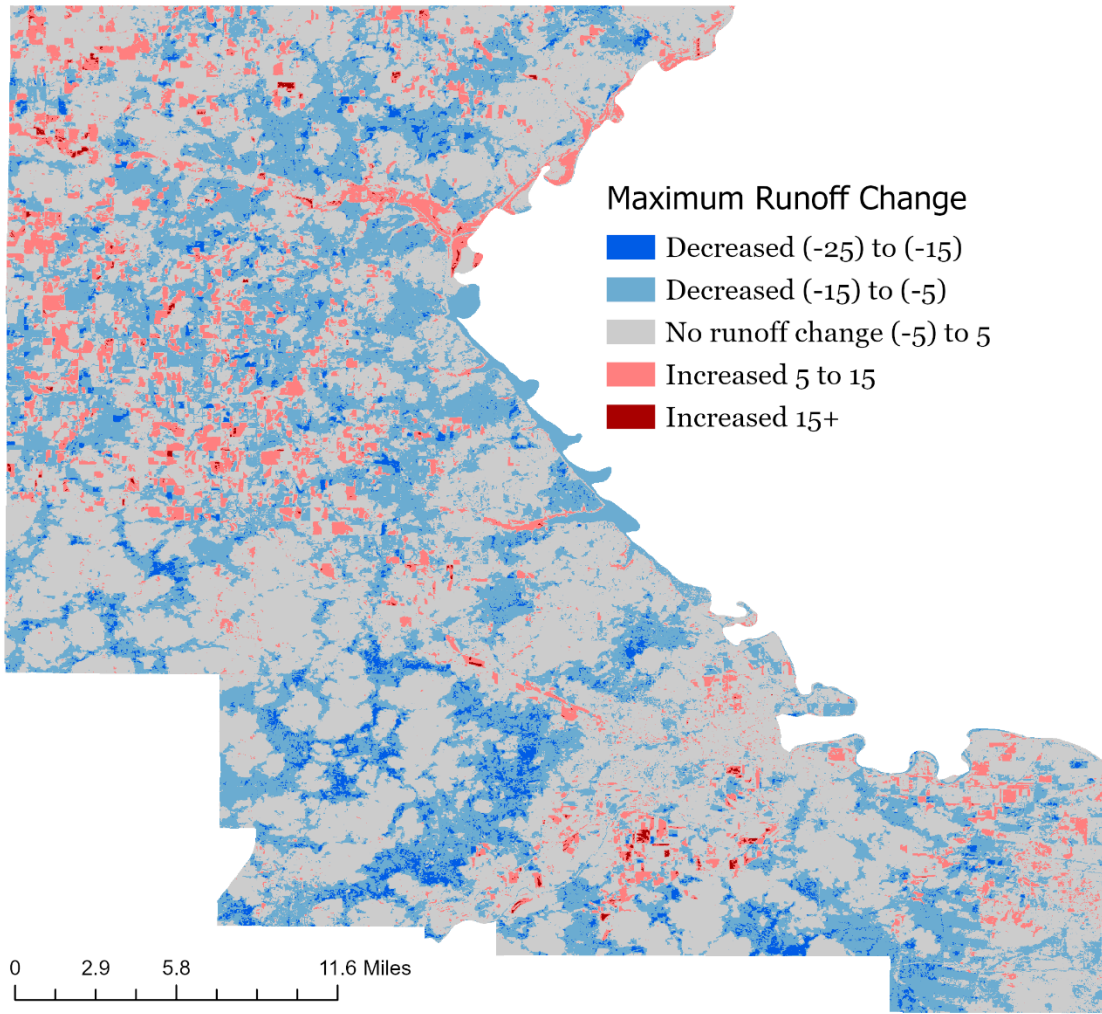

- The City of Manhattan, Kansas
- Riley County Department of Planning and Development
- Kansas Department of Health and Environment
- Kansas Forest Service
- Riley County Conservation District
- Kansas State University

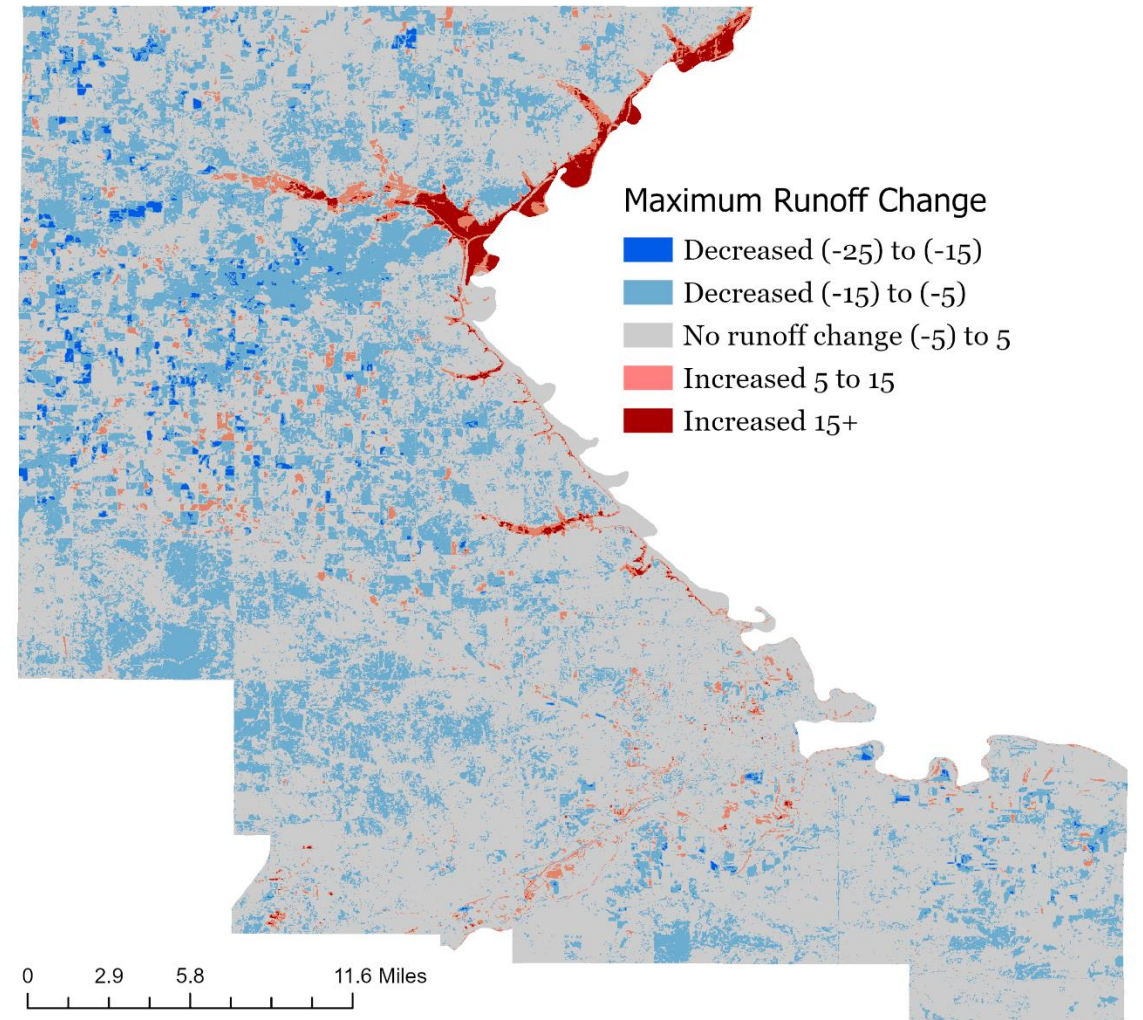

METHODOLOGY

RESULTS

Early Rainy Season 2006-2019

Late Rainy Season 2006-2019

OUTCOMES & CONCLUSIONS

Updated land use land cover maps

Tutorials on calculating a curve number to inform flood resiliency planning

Seasonal variation analysis through dynamic calculation

Flood risk increased in 2.67% of the county

Thank You.

Using Earth Observations and Statistical Models to Enhance Drought, Food Security, and Agricultural Outlooks in Eastern and Southern Africa

Services: Monitoring Illegal Mining (Galamsey) in Ghana

- Galamsey driven **deforestation doubled** between 2015 and 2018 contributing to **water pollution** and **land degradation**
- Mapping identified areas of illegal mining activities informs where **monitoring** and **restoration interventions** are needed

Photo credit: Jordi Perdigo

The Regional Cropland Assessment and Monitoring Service

- AST Nakalembe supported the development of the regional and country **crop conditions bulletins**
- Associated satellite derived crop masks and sampling framework **reduced costs by 70%** to the Kenya State Department of Agriculture, allowing for insurance protection to **expand from 900 to 425,000 farmers**.
- In 2019, more than **12,000 farmers were compensated** for crop losses

CROP CONDITIONS

The cropping season was characterized by a timely start in western parts of the equatorial region and above normal rains in northern sub-regions of Eastern Africa. Planting is expected in June for the main cereals in northern sub-regions, while crops in the equatorial and southern sub-regions are in vegetative stages and early maturity in the southern sub-region. Crops are generally in favourable condition due to above average rainfall. In some of the crop lands, excessive rainfall led to flooding in localized scale. Desert locust poses a threat to crops in high invasion zones due to vegetative crop stage coinciding with hatching and hopper development.

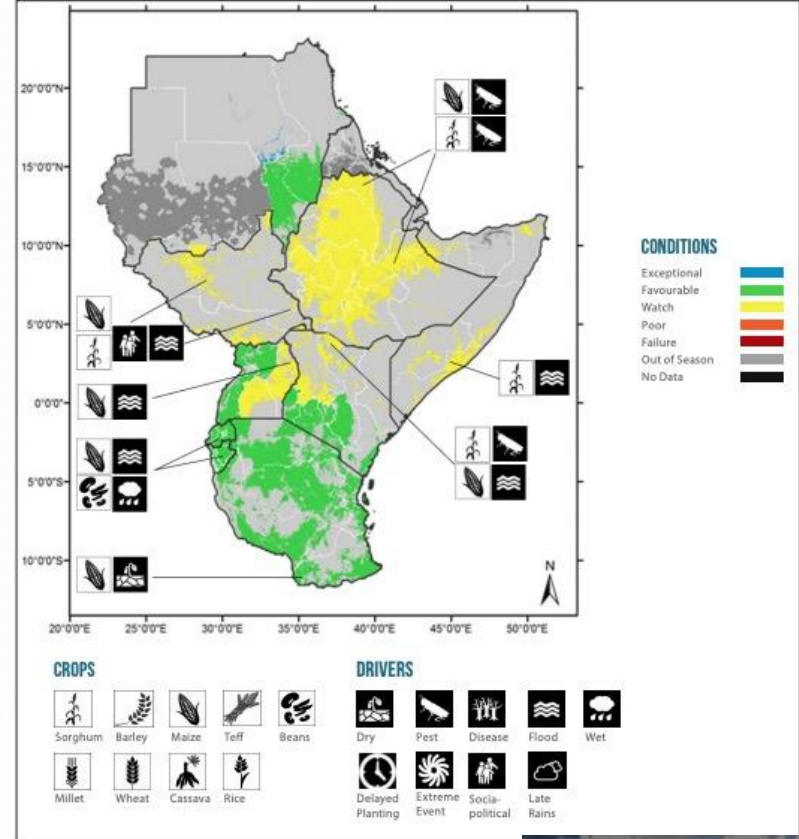

Photo Credit
USAID

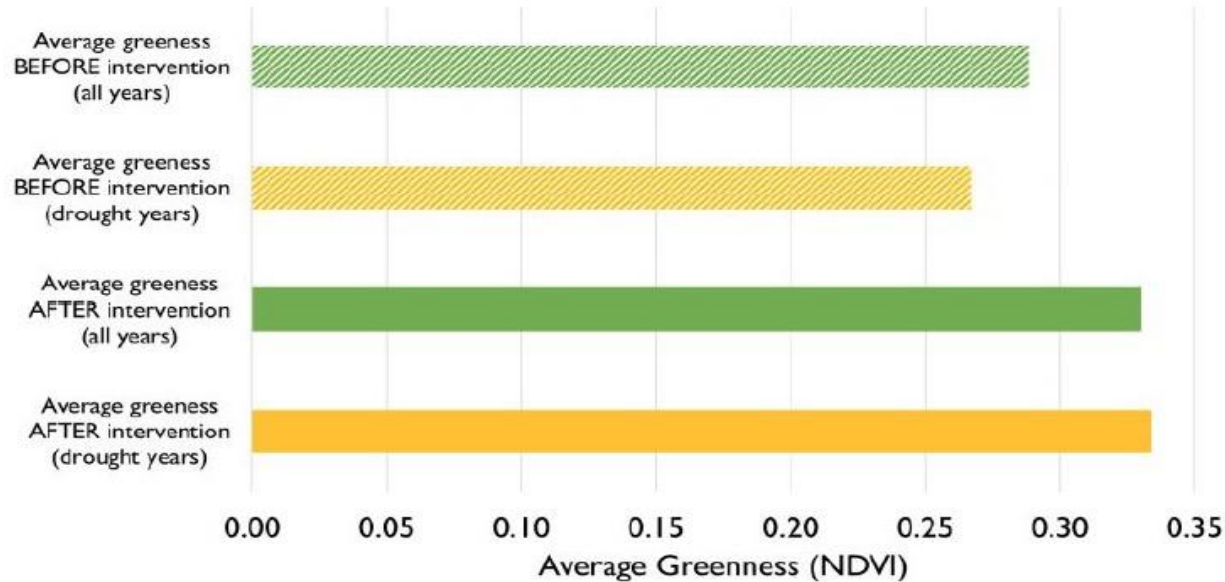

Photo Credit Catherine Nakalembe

Assessing Landscape Scale Resilience Change

SERVIR analysis helps illustrate the benefit of water infrastructure programs implemented by USAID in Tigray, Ethiopia

2006

2019

- Average greenness at project sites is higher than pre-intervention greenness
- Increased water availability in drought years
- Faster vegetation recovery at locations where water infrastructure exists
- Water access improved during cropping seasons and allowed for a second cropping season in some cases
- Methodology being scaled to support additional work in Ethiopia and efforts in Niger

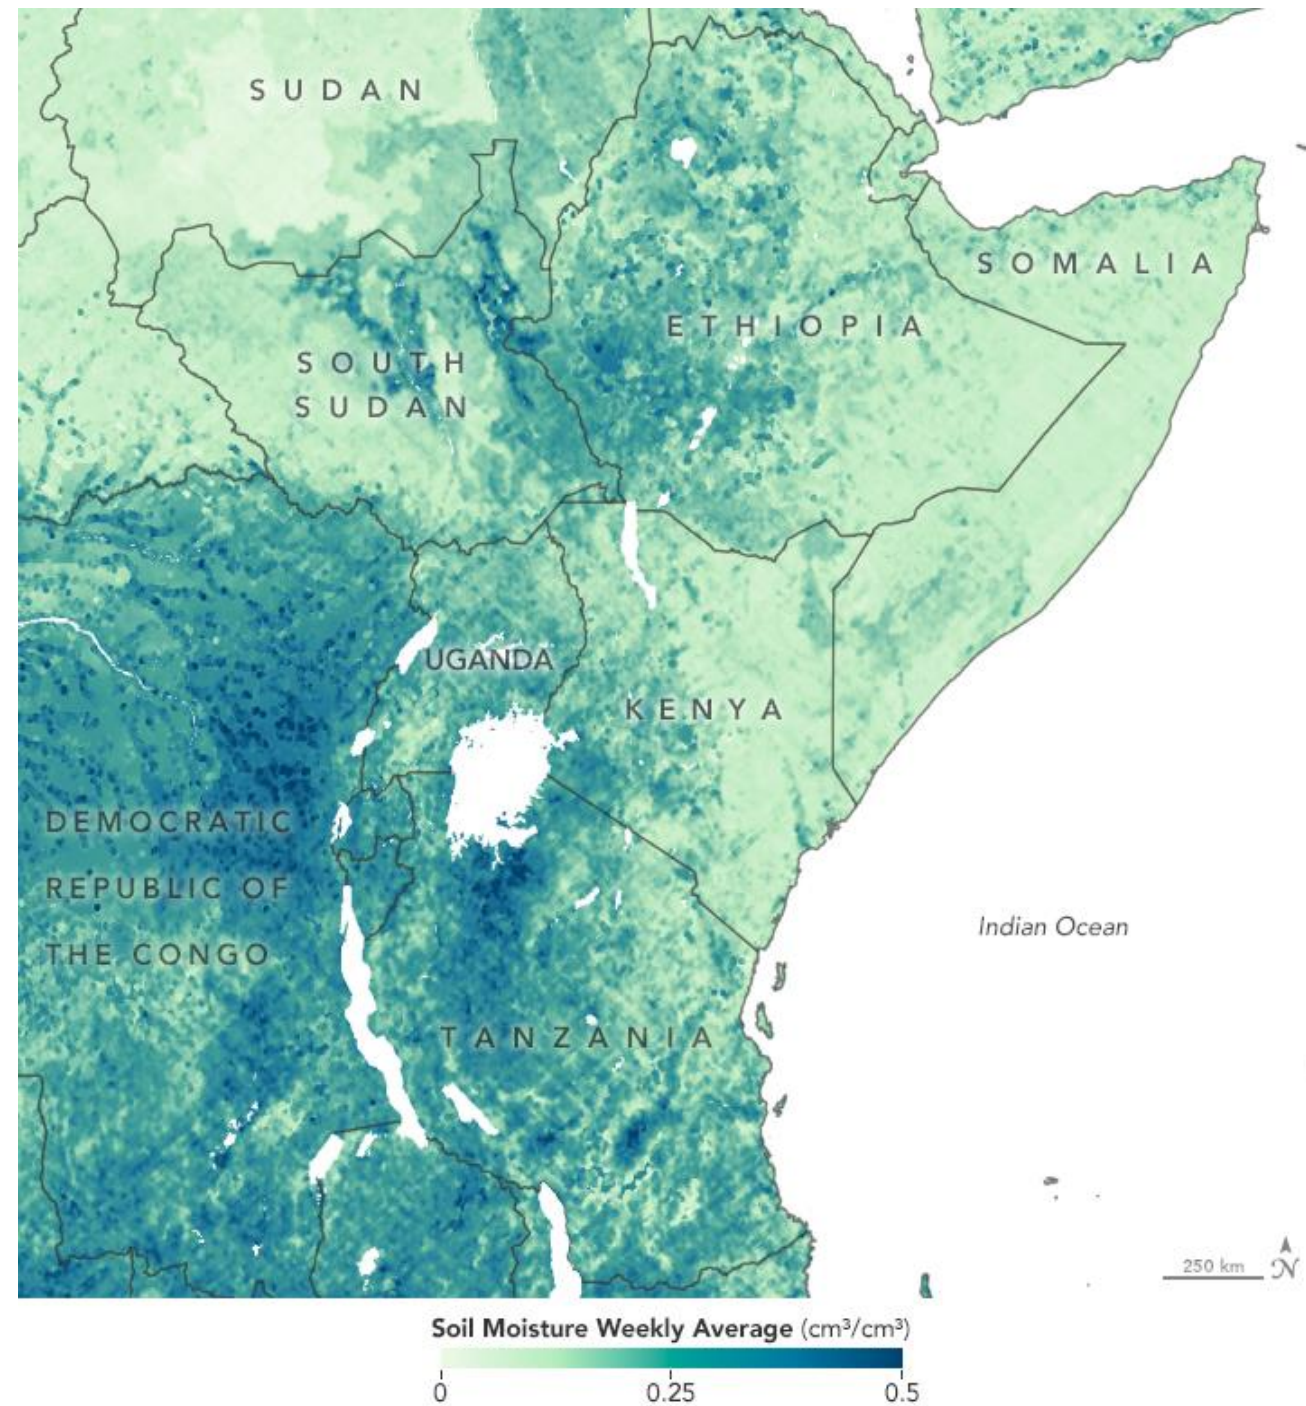

Improving Locust Monitoring and Modeling across Africa

In response to the recent unprecedented upsurge in Desert Locust activity in East Africa, SERVIR, in collaboration with NASA Harvest and Disasters, & FAO to map and model high-resolution **soil moisture** to identify areas at high risk for egg laying to **target control measures**

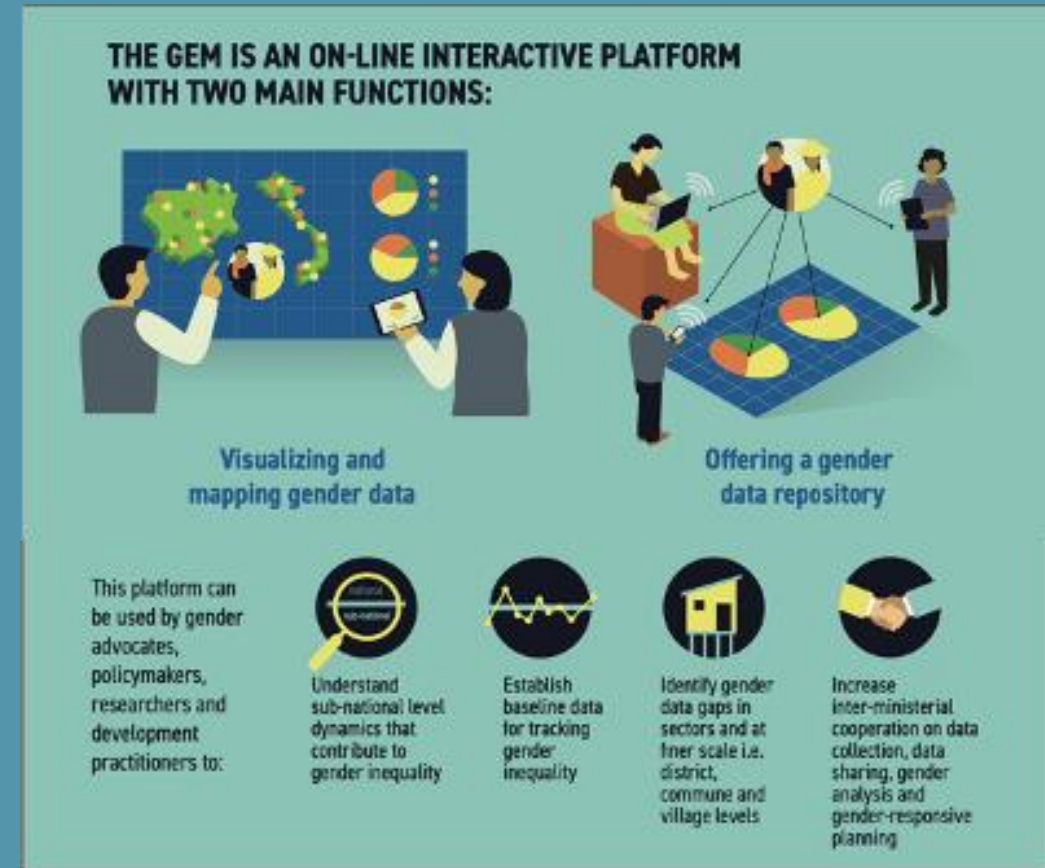

These methods were supported by work done with SERVIR West Africa

Gender Integration and Action

1. Building women leaders and gender champions in SERVIR
2. Empowering women and girls to explore STEM fields
3. Integrating gender considerations in service planning
4. Using remote sensing and GIS to address development issues that are inclusive of underrepresented groups

Thank You.
